**Abstract**—Structural Engineers are mainly concerned with finding out the behavior of a structure when subjected to horizontal forces and adequate stiffness is required for the buildings which are high rise in order to confront horizontal forces aroused by winds and earthquakes. To confront the horizontal forces i.e., lateral loads developed by earthquakes and to contribute more stiffness to the structure we use Shear walls, which are added to the interior of the proposed structure. The principle objective of this project is to Plan, analyse and design a multi-storeyed building [ G + 4(3 dimensional frame)] using ETABS. The design methods used in ETABS analysis are Limit State Design conforming to Indian Standard Code of Practice. ETABS features a state-of-the-art user interface, visualization tools, powerful analysis and design engines with advanced finite element and dynamic analysis capabilities. From model generation, analysis and design to visualization and result verification, ETABS is the professional's choice. Initially it started with the analysis of simple 2 dimensional frames and manually checked the accuracy of the software with the results. The results proved to be very accurate for all possible load combinations [dead, live, wind and seismic loads].

**Keywords**—Analysis and designing, Etabs, commertial building

## 1. INTRODUCTION

Structural engineering is a wider discipline under the field of civil engineering. It is a vast topic with unlimited theories and practices. It's a field that is still developing with huge innovations and ideas. The roles and responsibilities of a structural engineer includes structural designing, selection of materials best suited for the structure, analysis of structures etc. The present project deals with the analysis and design of a multi storied commercial complex at Puthiyara, Kozhikode. Structural designing include calculating loads and stresses acting on the building, analysis for the loads, design of sections of structures to sustain the loads. So that the structure designed will withstand the load predicted safely.

Analysis of structure is presently carried out by software like ETABS, SAP, STAAD etc. As years pass new software are being developed for analysis of structures at different condition of loads like wind, earthquake etc. the results can be understood and interpreted from the software to know the validity of values provided as output.

Now a days framed structures are preferred for commercial buildings. The framed system of construction has mainly two advantages. Firstly, the walls, which are used for, are not load bearing ones and hence the thickness of the walls can be reduced to a considerable extent. This reduces weight of the building and the load transferred to the foundation will be lessened. Subsequently the construction materials can be saved. Secondly the floor area of the building can be increased

A structure is subjected to various types of loading such as permanent, movable and occasional. The permanent loads are due to self-weight of structure, semipermanent ones are due to fixtures, furniture, stationary etc. which are rarely moved and is considered as Imposed Loads or live loads. 2 Movable loads are due to moving vehicles, etc. The occasional loads are due to wind, earthquake or floods.

Earthquake has also become one of the natural challenging factor for the efficient construction work. It is one of the dominant constrains while designing the frame building in the earthquake prone zone. Earthquake is a natural phenomenon as old as history of earth itself and is considered to be the most unpredictable one among all other natural disasters. Now a days, designers and engineers are giving more emphasis towards the earthquake resistance while analyzing and designing any structure to minimize the seismic impact.

## 1.1 DESIGN PHILOSOPHIES

There are three philosophies for the design of reinforced concrete namely:

- 1) Working stress method
- 2) Ultimate load method
- 3) Limit state method

## 1.2 STAGES IN STRUCTURAL DESIGN

The process of structural design involves the following stages

- Structural planning.
- Estimation of loads.
- Analysis of structure.
- Member design.
- Drawing, detailing and preparation of structures.

## 2.OBJECTIVE

- To analyse and design a G+4 commercial building.
- To prepare the master plan for the commercial building
- To compare the result with ETABS

### 3. PLAN OF COMMERTIAL BUILDING

#### 4. METHODOLOGY

## 5. A BRIEF DESCRIPTION OF SOFTWARE'S USED IN TRAINING

## 5.1 ETABS 2017:

ETABS is an engineering software product that caters to multi-story building analysis and design. Modeling tools and details, and cross-sections may be generated for concrete and steel structures. ETABS provides an unequalled suite of tools for structural engineers designing buildings, whether they are working on one-story industrial structures or the tallest commercial high-rises. Immensely capable, yet easy-to-use, has been the hallmark of ETABS since its introduction decades ago, and this latest release continues that tradition by providing engineers with the technologically-advanced, yet intuitive, software they require to be their most productive

## 5.2 AUTO-CAD 2016:

All the drawing and detailing works for this training were done by making use of AutoCAD 2007, developed by M/s. AUTODESK, USA. As such, this is the pioneering software in CAD. AutoCAD is a vector graphics drawing program. It uses primitive entities such as lines, poly-lines, circles, arcs and text as the foundation for more complex objects. AutoCAD's native file format, DWG, and to a lesser extent, its interchange file format, DXF has become the standards for interchange of CAD data..

## 6. MODELING IN ETABS

### 8.1 Auto Wind Loading

#### Indian IS875:1987 Wind Load Calculation

Lateral wind loads for load pattern WL X according to Indian IS875:1987, as calculated by ETABS

### Exposure Parameters

Exposure From = Diaphragms

Structure Class = Class B

Terrain Category = Category 2

Wind Direction = 0 degrees

Basic Wind Speed,  $V_b$

$V_b = 39$  meter/sec

Windward Coefficient,  $C_{p,wind}$

$C_{p,wind} = 0.8$

Leeward Coefficient,  $C_{p,lee}$

$C_{p,lee} = 0.5$

Top Story = Story6

Bottom Story = Base

### Factors and Coefficients

Risk Coefficient,  $k_1$  [IS 5.3.1]

$k_1 = 1$

Topography Factor,  $k_3$  [IS 5.3.3]

$k_3 = 1$

### Lateral Loading

Design Wind Speed,  $V_z$  [IS 5.3]

$V_z = V_b k_1 k_2 k_3 \quad V_z = 40.837095$

Design Wind Pressure,  $p_z$  [IS 5.4]

$p_z = 0.6 V_z^2$

### Applied Story Forces

Lateral wind loads for load pattern WL Y according to Indian IS875:1987, as calculated by ETABS

### Exposure Parameters

Exposure From = Diaphragms

Structure Class = Class B

Terrain Category = Category 1

Wind Direction = 90 degrees

Basic Wind Speed,  $V_b$

$V_b = 39$  meter/sec

Windward Coefficient,  $C_{p,wind}$

$C_{p,wind} = 0.8$

Leeward Coefficient,  $C_{p,lee}$

$C_{p,lee} = 0.5$

Top Story = Story6

Bottom Story = Base

Include Parapet = No

### Factors and Coefficients

Risk Coefficient,  $k_1$  [IS 5.3.1]

$k_1 = 1$

Topography Factor,  $k_3$  [IS 5.3.3]

$k_3 = 1$

### Lateral Loading

Design Wind Speed,  $V_z$  [IS 5.3]

$V_z = V_b k_1 k_2 k_3 \quad V_z = 42.787095$

Design Wind Pressure,  $p_z$  [IS 5.4]

$p_z = 0.6 V_z^2$

### Applied Story Forces

Story	Elevation m	X-Dir kN	Y-Dir kN
Story6	19.6	0	9.3201
Story5	16.3	0	88.1952

Story 2	6.4	0	39.5091
Story 1	3.1	0	9.1953
Base	0	0	0

### 9. LOAD COMBINATIONS

Design of the structures would have become highly expensive in order to maintain either serviceability and safety if all types of forces would have acted on all structures at all times. Accordingly the concept of characteristic loads has been accepted to ensure at least 95 percent of the cases, the characteristic loads are to be calculated on the basis of average/mean load of some logical combinations of all loads mentioned above. IS 456:2000, IS 875:1987 (Part-V) and IS 1893(part-I):2002 stipulates the combination of the loads to be considered in the design of the structures. The different combinations used are:

Table 4.10 - Load Combinations

Name	Load Case/Combo	Scale Factor	Type	Auto

## 10 ANALYSIS RESULTS

The structure was analysed as ordinary moment resisting space frames in the versatile software Etabs 2015. Joint coordinate command allows specifying and generating the coordinates of the joints of the structure, initiating the specifications of the structure. Member incidence command is used to specify the members by defining connectivity between joints. The columns and beams are modelled using beam elements. Member properties have to be specified for each member. From the analysis, maximum design loads, moments and shear on each member was obtained. From these values, we design the structure

## 11 DESIGN OF RC BUILDING

The aim of structural design is to achieve an acceptable probability that the structure being designed will perform the function for which it is created and will safely withstand the influence that will act on it throughout its useful life. These influences are primarily the loads and the other forces to which it will be subjected. The effects of temperature fluctuations, foundation settlements etc. should be also considered. The design methods used for the design of reinforced concrete structures are working stress method, ultimate load method and limit state method. Here we have adopted the limit state method of design for slabs, beams, columns and stairs. In the limit state method, the structure is designed to withstand safely all loads liable to act on it through its life and also to satisfy the serviceability requirements, such as limitation to deflection and cracking. The acceptable limit of safety and serviceability requirements before failure is called limit state. All the relevant limit states should be considered in the design to ensure adequate degrees of safety and serviceability. The structure should be designed on the basis of most critical state and then checked for other limit states.

### RESULT AND CONCLUSION:

Analysis and design of an apartment building having G+10 storeys is done. Analysis is done by using the software ETABS V15.2, which proved to be premium of great potential in analysis and design of various sections. The structural elements like RCC frame, shear wall and retaining walls are also provided. As per the soil investigation report, an isolated footing is provided. The design of RCC frame members like beam and column was done using ETABS. The analysis and design was done according to standard specifications to the possible extend. The various difficulties encountered in the design process and the various constraints faced by the structural engineer in designing up to the architectural drawing were also understood.

### FUTURE SCOPE:

- Dynamic analysis can also be done using ETABS.
- Slab and footing can be designed using SAFE.
- In ETABS 2017 different types of slabs can be designed.
- The sections designed in ETABS can also be designed by conventional methods or STAAD-PRO and result can be compared.
- The irregular structures subjected to different load cases can also be analyzed and designed in ETABS.
