Abstract—The Connecting rod is a high volume production from automobile Side. Connecting rod is subjected to more Stress than other engine components. Failure and damage are also more in connecting rod. So stress analysis in Connecting rod is Very important. In this study, detailed load analysis was performed on connecting rod, followed by finite element method in Ansys-13 medium. In this regard, in order to calculate stress in Different part of connecting rod, the total forces exerted connecting rod were calculated and then it was modeled, meshed and loaded in Ansys software. The maximum stresses in different parts of connecting rod were determined by Analysis. The maximum pressure stress was between pin end and rod linkages and between bearing cup and connecting rod linkage. The maximum tensile stress was obtained in lower half of pin end and between pin end and rod linkage. It is suggested that the results obtained can be useful to bring about modification in Design of connecting rod.

Index Terms—Tractor; Engine; Connecting Rod; Finite Element; Stress Analysis; Ansys software

I. INTRODUCTION

Connecting rods are widely used in variety of car engines. The function of connecting rod is to transmit the thrust of the piston to the crankshaft, and as the result the reciprocating motion of the piston is translated into rotational motion of the crankshaft. It consists of a pin-end, a shank section, and a crank-end. Pin-end and crank-end pin holes are machined to permit accurate fitting of bearings. One end of the connecting rod is connected to the piston by the piston pin. The other end revolves with the crankshaft and is split to permit it to be clamped around the crankshaft. The two parts are then attached by two bolts. Connecting rods are subjected to forces generated by mass and fuel combustion. These two forces results in axial and bending stresses. Bending stresses appear due to eccentricities, crankshaft, case wall deformation, and rotational mass force. Therefore, a connecting rod must be capable of transmitting axial tension, axial compression, and bending stresses caused by the thrust and pull on the piston and by Centrifugal force (Afzal and Fatemi, 2003). A connecting rod is subjected to many millions of repetitive cyclic loadings. Manufacturing technology of this machinery and also its quantity must be reached to optimum level. Above statements show the importance of stress analysis in Connecting rod for optimizing them. In this regard, dynamic stress analysis in connecting rods of this tractor was studied

II: MATERIALS AND METHODS:-

Properties of Connecting Rod Material (C70S6):-

III: Calculating Forces Exerted on Connecting Rods:-

In order to calculate stress in connecting rods it was analyzed for 3 separate parts, because the nature of forces exerted on difference parts of connecting rods are different.

1.1 Calculating forces exerted on pin end:-

The total force exerted on pin end in one cycle is state as: $F_{com} = F_g + F_i$  

$$(P_s - P_o)A_p - (m_p + m_w)Rw^2(\cos \alpha + \lambda \cos 2\alpha)$$

Where,  

$P_s$ = Atmosphere pressure (KPa),  

$A_p$ = Piston area (m),  

$M_p$ = Piston and pin mass (kg),  

$M_s$ = Mass of above part of pin end (kg),
\[ U = \text{Revolution speed (rpm)}, \]
\[ R = \text{crankshaft radius (m)}, \]
\[ F_g = \text{force resulted by gas pressure in combustion chamber (N)}. \]

The maximum pressure force exerted on connecting rod is happened in the maximum torque but the maximum tensile force happened in the maximum revolution speed. Hence, to calculate the maximum pressure force exerted on pin end, 1300 rpm, and to calculate the maximum tensile force, 2200 rpm, were considered (as the information taken from company).

Figures 1 and 2 obtained for total force exerted on pin end considering Eq.1. As shown in figures 1 and 2, the maximum pressure force exerted on pin end was 21600 N.

1.2. Calculating forces exerted on Rod:-

The total force exerted on rod in one cycle is state.

\[ F_{\text{com}} = F_p + F_g \]

\[ (P_g - P_o)A_p - (m_p + m_{\text{crp}})Rw^2(\cos \alpha + \lambda \cos 2\alpha) \] .............. (2)

Where \( M_{\text{crp}} \) is mass of connecting rods above part from gravity centre (kg). As stated above, to calculate the maximum pressure force exerted on Small end (pin end) side is 21600N (Company Data)

1.3. Calculating forces exerted on crank end:-

The combustion pressure force doesn’t have effect on crank end, but it is affected by inertia force. Also, screws in crank end are over load. Always, they preloaded 2 to 4 time related to the maximum inertia force to prevent departing of two bearing cup.

Inertia force results tensile stress and preloading force results pressure stress in crank end of connecting rod. Preloading (MPa) in screws to link bearing cup and above part of crank end strongly and also to prevent screws’ breaking is equal to:

\[ P_{jr} = \frac{3P_{jr\ max}}{b_h} \] ............................................. (3)

Where \( b_h \) is number of screws in crank end and \( P_{jr\ max} \) is the maximum inertia force exerted on crank end of connecting rods.

The inertia force exerted on crank end was calculated as

\[ P_g = -w^2R \left[ m_p + m_{\text{crp}} \cos \alpha + \lambda \cos 2\alpha + m_{\text{cr}} \cdot m_c \right] \] .............. (4)

Where \( m_p \) = Mass of the piston assembly (kg), \( m_{\text{crp}} \) = concentrated mass of connecting rods on the crank end, \( m_{\text{cr}} \) = concentrated mass of connecting rods on the pin end, \( m_c \) = concentrated mass of crankshaft on crank end.

Figure 1 shows the inertia force exerted on crank end versus crank angle diagram in one cycle. Maximum inertia force exerted on crank end was 86400 N

IV: Modeling, Meshing and Loading Forces on Connecting Rod:-

After calculating forces exerted on different parts of connecting rod in most critically, it was modeled and meshed in ANSYS, software. Mesh size is 1 mm, Smoothing is high And Relevance center is fine Then We obtained Node of 259579 and Element of 152873. It is very fine meshing so Result obtained is very Accurately and

To calculating stress in each connecting rod parts, calculated forces for each parts was exerted on corresponding parts in modeled connecting rod in ANSYS, software’s medium considering following notes: Inertia forces were evenly exerted on pin end inner level (Fig.1) The value of these forces was calculated using following formula:

\[ P_g = \frac{2F_g}{\pi r_1} \left[ \sin \theta \left( \frac{N}{m^2} \right) \right] \] ............................. (6)

Where \( P_g \) is force per unit area (N/m) and \( F_g \) is force resulted from combustion (N).

3. The force resulted from falsifying of pin end’s linier
and also from friction between liner and piston pin that were exerted on pin end inner level all situations. These forces cause pressure stress in liner and tensile stress in connecting rod.

4. To obtain stress resulted from preloading in crank end, the force must be evenly exerted on both side of that. Then, average pressure was obtained from dividing force by backrest level of screws.

V: RESULTS AND DISCUSSION:-

Stress analyzing in different parts of connecting rod:-
There are two different conditions were considered
1) Pin end Compressive force
2) Crank end compressive force.

Following results were obtained after exerting forces in ANSYS medium.

<table>
<thead>
<tr>
<th></th>
<th>Load</th>
<th>Max. Stress (Mpa)</th>
<th>MAX. Strain (Micron/mm)</th>
<th>Total Deformation (micron/mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Big End Comp.</td>
<td>86400N</td>
<td>359.84</td>
<td>1.7</td>
<td>152.1</td>
</tr>
<tr>
<td>Small End Comp.</td>
<td>86400N</td>
<td>358.75</td>
<td>1.7</td>
<td>135.3</td>
</tr>
<tr>
<td>Big End Tensile</td>
<td>21600N</td>
<td>429.02</td>
<td>2.0</td>
<td>155.2</td>
</tr>
<tr>
<td>Small End Tensile</td>
<td>21600N</td>
<td>469.88</td>
<td>2.9</td>
<td>188.5</td>
</tr>
</tbody>
</table>

F.O.S = Ultimate Stress / Maximum Stress

= 600/359.84

= 1.66

**Case I:-Crank End Compressive Analysis.**

**Case II:- Pin End Compressive Analysis.**

---

**Fig 3** Connecting rod loading Condition

**Fig 4** Connecting rod Von misses Stress Distribution.

**Fig 5** Connecting rod Von misses strain

**Fig 6** Connecting rod Total Deformation

**Fig 7** Connecting rod Von misses Stress Distribution.

**Fig 8** Connecting rod Von misses strain
The following conclusions obtained from this study:
1) The maximum stress is between pin-end and rod-linkage, and between bearing-cup and connecting rod linkage.
2) The maximum tensile stress was obtained in lower half of pin end and between pin end and rod linkage.
3) Results of FEM method and results of experimental equations were similar (Maximum difference was only ±13%) this shows accuracy of our modeling, meshing and loading
4) Common stresses in C70S6_Split connecting rods like this connecting rod is between 350 to 650 MPa. It can be extract that cause of high fail of this component is over stresses of common range.
5) Value of F.O.S. (Factor of Safety) of connecting rod is between 1.6 to 1.7. Which indicate Safe Design of Connecting Rod.

VII Future Scope:-
In this study we consider only Static Analysis. This study can be extended by Dynamic Analysis also for that we have T-0 Diagramed is needed. Also optimization study is done.
