ABSTRACT

Cloud Computing is a type of parallel and distributed system consisting of a collection of interconnected and virtualized computers that are dynamically provisioned and presented as one or more unified computing resources based on a service-level agreement. The success of the forthcoming endeavors of human civilization depends on the proper utilization of the resources which are becoming scarce day by day. It is observed that while some people have ability to use the resources, some other people with disabilities are suffering from it. This discrimination could be wiped out by a proper management and strategy adopted by the Government of different countries in the form of a properly implemented and managed E-Governance. This paper arises from our quest to understand how to design a Saas (Software as Service) support for more and government to explore emerging opportunities and challenges presented by "cloud computing." specifically on how it might help or hinder a more "accessible" future for people with special access needs. The existing e-Governance frameworks cannot address all categories of users. The research is intended to propose a new effective framework of E-Governance based on cloud computing concept, which would intelligent as well as accessible by all, including people with disabilities.

KEYWORDS: Cloud computing, E-Governance, SaaS, Access

INTRODUCTION

It is beyond doubt that e-Governance can smoothen the working procedure of Government machinery by providing transparency, effective working, instant response and availability of information of Government machinery to end users, time to time. The existing e-Governance is cost effective in nature and finds it unable to address all categories of users. The success of e-Governance lies on wiping out of this discrimination by providing accessibility of different web services of e-Governance irrespective of geographical and language barriers. Accessing the different web services of e-Government by using a sophisticated laptop or desktop are beyond the reach of a large number of users like visually disabled people. Hence e-Governance facilities are confined within limited inhabitants and remain unsuccessful. Keeping all these in mind, we propose a new effective framework of e-Governance based on E-Governance, SaaS, Accessibility, cloud computing concept. Cloud computing is computing over a cloud, where a cloud consists of clusters or grids of 1000s of commodity machines (e.g. Linux Pcs) and software layers that is responsible for distributing application data across the machines, parallelizing and managing application executing across the machines and detecting and recovering from machine failure . Here when we come to accessibility of E-Governance web Pages, we will say that accessible web design is a sign of good web design. A lot of the information on the Cloud is not accessible to people with disabilities because of poor designing of E-Governance websites .While many web site managers and developers accommodate various browser constraints, most of them do not realize that they are developing sites that people with disabilities have difficulty in navigating, or in many cases. Here our proposed work is when designing E-Governance websites on cloud computing the text is large enough because low vision users usually need a screen enlarger to enlarge the text and providing audio options to notify low vision users about newer information or state changes. All essential information can be accessed via text, such that blind users can use screen readers or Braille display to access the information; the information includes graphics, image maps, multimedia presentations, etc.; The cloud computing can help to make computing ubiquitous and bring it within the reach of all types of users. Moreover, apart from traditional e-Governance framework, our proposed framework of e-Governance would be intelligent enough to help the end users like disabled.

The remainder of this paper is organized as follows: Section 2 cloud computing overview providing a brief review of normative literature on this research field. The purpose of this section is to explain what cloud computing really is and from what is consisted of. Thereafter, a discussion on: (2.1) Cloud Computing Service Models (2.2) deployment models of cloud computing is carried out. Section 3 Clouds Computing Its Utilization for E-Governance. The purpose of this section is to highlight the benefits and limitations that derived from the migration of government services to the cloud. Section 4 Proposed Cloud Architecture for visual disabilities on e- Governance, this section explains the new effective framework for visually disabled people to use e-Governance web services on the cloud. The paper closes with conclusions and future research issues.

2.1 Cloud Computing Service Models

The service model comprises of three core options within the Cloud Computing environment.

Fig 1.Working of cloud computing

2.1.1 Software as a Service (SaaS)

Sometimes referred to as “software on demand”, is software that is deployed over the internet and/or is deployed to run behind a firewall on a local area network or personal computer. With SaaS, a provider licenses an application to customers either as a service on demand, through a subscription, in a “pay-as-you-go” model, or (increasingly) at no charge. This approach to application delivery is part of the utility computing model where all of the
Cloud computing is a technology that uses the internet and central remote servers to maintain data and applications. Cloud computing allows consumers and businesses to use applications without installation and access their personal files on any computer with internet access. It allows for much more efficient computing by centralizing storage, memory, processing and bandwidth. Very simple example of cloud computing is Yahoo email or Gmail etc. There is no need of software or a server to use these mail facilities except an internet connection. The server and email management software is all in the cloud (internet) and is totally managed by the cloud service provider Yahoo, Google etc. The consumer gets to use the software alone and enjoy the benefits. Cloud computing provides basically three service segments: SaaS (Software as a service), PaaS (Platform as a service) and IaaS (Infrastructure as a service). Each segment serves a different purpose and offers different products for businesses and individuals around the world. The most affected would be various companies and Government due to this paradigm shift. This technology can be fully utilized for various E-Governance services provided by the government at the door steps of common man. In case of Companies software companies, internet service providers and hardware manufacturers would also be affected a lot if Cloud computing is being utilized properly. SaaS can be utilized for various E-Governance services (G2B, G2G, G2E, and G2C). In case of PaaS database services, backup services and other middleware services can be provided effectively. IaaS allows various stakeholders to utilize the services of Hardware, Storage and Network. Cloud computing potential lies not only in the evolution of technology but also in a sourcing strategy that uses resources shared by a large number of users.

Cloud computing benefits may help in minimizing certain challenges of E-Governance. Cloud computing can be helpful International Journal of Computer Applications (0975 – 8887) in rolling out new projects and services. IaaS feature of cloud can be
utilized for this purpose. Hence clouds can minimize the time to deploy new application instances. Corruption is a big problem in India and cloud computing can help in analyzing a huge volume of data and detecting any fraud. Corruption and red tape is controlled by keeping the providers of the services accountable. Cloud Virtualization technologies allow backups and restoring and hence help in disaster recovery. Cloud computing provides the facility of application migration seamlessly as compared to traditional data centers. Also various security features can be provided in the E-Governance applications with the help of Cloud computing. Cloud computing also helps in minimizing pollution. Because if we are to maintain our resources in many places it will require lots of power, air conditioning at all places but as we utilize the same infrastructure in case of a cloud computing lot of power consumption as well as the environment can be saved particularly in case of data centers. Do not doubt there are many benefits of cloud computing in the era of the information age. But still we hesitate in utilizing the potential of cloud computing due to various challenges of cloud computing.

4. PROPOSED CLOUD ARCHITECTURE FOR VISUAL DISABILITIES IN E-GOVERNANCE

In this research, we consider users with blindness, low vision and high contrast or color blindness. A blind person is one who cannot use a visual at all. These are users who read Braille displays or listen to speech output (from a screen reader) to get information from their systems. Users with low vision have a wide variety of visual capabilities. Estimates suggest that there are approximately 9-10 million people with low vision. A person with low vision can be considered to be someone who can only read print that is very large, magnified, or held very close.

4.1 Blind Users

Designing an e-governance web site that should be relative to blind users is: Blind users have screen reading software that can read the text contents of buttons, menus, and other control areas but screen readers cannot read the contents of an icon or image; they can only read the descriptive label or accessible name associated with them. Meaningful names should be provided for user interface objects in their code. Meaningful names can allow some screen reading software to provide useful information to users with visual impairments. Rather than naming an eraser graphic "widget5", for example, the code should call it "eraser" or some other descriptive name that will users will understand if spoken by a screen reader.

Without such descriptive information, blind or low vision users may find it difficult or impossible to interpret unlabeled, graphically labeled, or custom interface objects. Providing descriptive information may provide the only means for access in these cases. As an added selling point to developers, meaningful widget names make for code that is easier to document and debug. International Journal of Computer Applications (0075 – 8887) providing a text equivalent for every non-text element and embedded objects (e.g., via "alt", "longdesc", or in element content). This includes: images, graphically representations of text (including symbols), image map regions, animations (e.g., Animated GIFs), applets and programmatic objects, ASCII art, frames, scripts, images used as list bullets, spacers, graphical buttons, sounds (played with or without user interaction), standalone audio files, audio tracks of video, and video.

4.2 Low Vision & Color Blindness

Our goals of accessible web design relative to low vision users are:

1. Larger font size

The common theme for low vision users is that it is challenging to read what is on the screen. Those who have low vision need the assistance of a hardware or software magnifier to enlarge the text beyond simple font enlargement. In E-Governance web sites use of these screen magnification hardware & software to enlarge their view, performance and image quality are improved if larger font sizes are available prior to magnify. Using the largest font size supported by the browser (the largest is only available when High Contrast mode is turned on).

2. Configurable font size

All fonts, including those in text panes, menus, labels, and information messages, can be easily configurable by users. There is no way to anticipate how large is large enough. The larger fonts can be scaled, the more likely it is that users with low vision will be able to use the software without additional magnification software or hardware.

3. Option of audio

A related problem for users with low vision is their limited field of view. Because of large fonts or magnify the screen through hardware or software, a smaller amount of information is visible at one time. A limited field of view means that these users easily lose context. Events in an interface outside of their field of view may go unnoticed. For these types of users we can use audio cues to corresponding texts and images on e-Governance websites. In addition, providing redundant audio cues (or the option of audio) can notify users about new information or state changes.

4. Minimize the users' memory load

For persons using screen magnification in software services, the effective size of the computer screen can be very small. Therefore, low vision users must rely on their own memory to integrate portions of a document.

5. Use the High Contrast option in the Accessibility Options section of the Control Panel, restart the browser, and make sure the page is still readable.

6. Minimize Visual Strain, if the websites are more complex in visualizing than the low vision people ca not get the correct information as they needed. So we can use simple visual designs in e-governance web sites and Avoid patterned or complex backgrounds. So that all disabled people can get the information what they needed.

7. Resize the browser window larger and smaller to see whether there is any problem with the layout of the page because low vision users using magnification software may have a smaller effective size of the browser window.

5. CONCLUSION

In this paper we discussed the Cloud Computing in general and discussed how Cloud Computing can improve the accessibility of e-Governance web services based on cloud Sass service model.
The SaaS model of service provision has the potential to become an important sourcing strategy for government organizations. SaaS is a type of service model to deliver software as a service instead of owning and maintaining software locally. Disabled people may have stronger needs for or benefits from the e-Governance services than the general population, but they have a lower usage rate. The main gate to access the E-government websites (SaaS) is browsing. As browsing the existing website is designed to cater to only normal people with no disabled people. But here, neither we have proposed cloud architecture for accessing the e-Governance web services to visual & cognitive disabilities only nor other disabilities like mobility impaired and hearing impaired. We intend to do so in our forthcoming endeavors.
