Abstract - All the automobile vehicles available are always set to changing speed and torque between engine and driving wheels. Torque is not directly changed but it can be done in the form of power using a suitable device. It is a very useful method that we adopt, and it is also easily affordable. Many other alternative, even though more elegant, and appear to be more effective are not feasible when it comes to transmission. This project mainly focuses on the design and fabrication of a gear box that can transmit torque to the maximum and also helps to do some useful work in automobile where power transmission is a major factor. The transmission of power is done in six speeds in this project. The setup uses two shafts and thirteen gears arranged in suitable distances to achieve the desired torque and speed.

Key words: Gear, Shaft, Dog clutch, Ball bearing, lever.

1. INTRODUCTION

The present day world is moving towards globalization. Now to keep at par with the global market, the countries follow a different set of standards. The main purpose of these standards is to make a product available, in every nook and corner of the world with exactly the same specifications without any single change.

The standards are being adopted in each and every field of technology and science. These changes, especially in automobile next to the clutch are the transmission in the transmission system of a motor vehicle. The word ‘transmission’ is used for a device that is located between clutch and propeller shaft. The device used for the transmission is Gear Box.

2. PURPOSE OF THE GEAR BOX

- The purpose is to provide high torque at the time of starting, accelerating and pulling load. When vehicle is starting a high torque is required at the driving wheels.
- Hence a device must provide to permit the engine crank shaft to revolve a relatively high speed, while the wheels turn at high speeds. This is obtained by a set of gears called a transmission or gear set. The gear set is enclosed in a metal box called a Gear Box.
- It helps to reduce the engine speed in the ratio of 4:1 in case of passenger cars and in a greater ratio in case of Lorries.
- It helps the turning of drive around 90 and to drive driving wheels at different speed.

3. THE WORKING OF 6 SPEED CONSTANT MESH GEAR BOX

The six speed constant mesh gear box has two shafts, one for the input and the other for output. Six gears are mounted on both the shafts and are in constant mesh. Ball bearings are connected to the gears on the output shaft which makes them to rotate freely on the output shaft.

The output gears have extensions on one side for the engagement purpose. The clutches are engaged and disengaged with the gears by the use of levers. The clutches are keyed to the output shaft. The engine flywheel is connected to the input shaft.

The gears on the output shaft rotate freely on the bearings. In order to engage the dog clutch with the gear the respective lever is moved. This moves the clutch towards the gear and the dog gets engaged with the extensions on the gear. The rotation is transferred to the output shaft. The wheels connected to the output shaft are also rotated.

4. DESIGN PROCEDURE

4.1. DESIGN CALCULATION

PINION
C45 steel
\[ \sigma_u = 630 \text{ MPa} \quad \text{HB}=215 \]

GEAR:
C45 steel
\[ \sigma_b = 210 \text{ MPa} \quad \text{E}=2.15 \times 10^5 \text{ N/ mm}^2 \]

\[ \text{[DATA BOOK} \quad \text{Pg No. 8.4, 8.5, 8.14]} \]

GEAR RATIO
\[ i = 1.4 \]

NUMBER OF TEETH

Teeth on Pinion: 38
Teeth on Gear: 54

TANGENTIAL LOAD

Power to be transmitted = 1.5 KW

Input speed =750 rpm

\( K_o = 1 \) (steady load) \( F_{te} = (P/V) K_o \)

\( V = \frac{\pi d_1 N_1}{60 \times 10^3} \)

\( V = \frac{\pi m Z_1 N_1}{60 \times 10^3} \)

INITIAL DYNAMIC LOAD:

\( [C_v] - \text{From Data Book PgNo. 8.51} \)

\( F_d = F_t x C_v \) Assume \( V_m = 3 \) m/s

\( V_m = 10 \) m/s \( F_d = (1005.6/2) \times 2 \)

\( C_v = (3+V_m)/3 \) \( F_d = (2011.3/m) \)

\( C_v = 2 \)

BEAM STRENGTH:

\( [F_s] \text{from Data Book PgNo. 8.50} \)

\( s = \frac{[\sigma_b]}{[\sigma_r]} \text{by}[\text{tm}] \) \( [\sigma_b] = \sigma_o/3 \)

\( [\sigma_b] = [(\sigma_o)/3] = 210 \text{mPa} \)

\( [y] \text{-From DataBook PgNo.8.50} \)

\( b = 10 \text{m [Assumption]} \)

\( y = 0.154 - (0.912/x_i) = 0.13 \)

[Take 20\degree INVOLOUTE]

\( F_e = [(210 \times 10 \times 0.13 \times \pi) \times \text{m}] \)

\( F_e = [(857.22 \text{ m}^2)] \)

EVALUATE

\( F_s = F_d \)

\( 857.2 \text{ m}^2 = 2011.3/\text{mm} = 1.32 \)

Standard Value

\( m = 1.5 \text{ mm} \)

\( [\text{From Data Book PgNo.8.2,Standard Value}] \)

Face value, \( b = 15 \) mm

Pitch diameter, \( d = 57 \) mm

Velocity, \( v = 2.237 \) m/s

4.2 RECALCULATED BEAM STRENGTH

\( [F_s] \text{ from Data Book PgNo.8.50} \)

\( F_e = [210 \times 15 \times 0.13 \times \pi \times 1.5] \)

\( F_e = 1928.47 \) N

ACCURATE DYNAMIC LOAD

\( F_d = F_e + [21V (b, F_1)] \)

\( F_d = [p/V] = 670.54 \)

\( b = 15 \) mm

\( V = 2.237 \) m/s

Assume Carefully Cut Gear:

\( e = 0.025 \)

\( [y] \text{-From Data Book Pg 8.53 Table 42, m upto 4} \)

\( c = 296.5 \)

\( F_d = 670.54 + [(46.977(51118.04))/46.977+71.54)] \)

\( F_d = 2699.19 \) N

\( F_d > F_s \)

Design is not safe

Assume precision Gear:

\( e = 0.0125 \)

\( [y] \text{-From Data Book Pg 8.53 Table 42, m up to 4} \)

\( c = 148.25 \)

\( F_d = 670.54 + [(46.977(2894.29))/46.977+53.79)] \)

\( F_d = 2019.844 \) N

\( F_d > F_s \)

Design is not safe

\( D_t = 57 \) mm

\( Q = 2i/(1+i) = [(2 \times 1.42)/2.42] = 1.173 \)

\( [\text{From Data Book PgNo.8.51}] \)

\( B = 20 \) mm

\( K = [(\sigma_o)^2 \sin 20]/1.4 \times [(1/(2.15 \times 10^3))+ (1/(2.15 \times 10^3))] \)

\( [\sigma_c] \) = Contact compressive stress
HCR - 48 [scale]

HB - 460 [Case hardened]

K\textsubscript{el} = 1 [life < 10\textsuperscript{7} rpm]

[Data Book Pg No. 8.17 Table 17]

\[ \sigma_c = C_r HRC K_{el} \]

\[ K = \left[ \frac{1272}{\sin 20} \right] \left( \frac{1}{2.15 \times 10^5} \right) + \left( \frac{1}{2.15 \times 10^5} \right) \]

\[ K = 3.67 \]

F\textsubscript{a} = 57 \times 1.173 \times 3.67 \times 20

F\textsubscript{w} = 40907.59 N

F\textsubscript{w} = F\textsubscript{a}

Design is Safe

Basic Dimensions:

MODULE \( m = 1.55 \text{mm} \)

FACE WORTH \( b = 20 \text{mm} \)

TEETH

\( Z_1 = 38 \)

\( Z_2 = 54 \)

PITCH DIAMETER

\( d_1 = 57 \text{mm} \)

\( d_2 = 81 \text{mm} \)

CENTER DISTANCE \( O = 69 \text{mm} \)

TOOTH DISTANCE \( H = 3.375 \text{mm} \)

4.3 DESIGN PROCEDURE FOR BEARING

SHAFT DIA: 10 mm

Bearing No: SKF 6200 [from Data Book Pg No. 4.13]

ISC NO: 10BCO2

Inner Dia: 10 mm

Outer Dia: 26 mm

Width: 9 mm

Life required for Bearing: \( 1 \times 10^7 \) rev

Dynamic capacity \( C = \left( \frac{L}{L_{10}} \right)^{0.6} P \)

Equivalent Load \( = P [X F_r + Y F_s] S \)

\[ L_{10} = 1 \text{mr} \]

\( K = 3 \) for Ball Bearing from Data Book

\[ F_r = [2 M_t D] \]

\[ M_t = \frac{P \times 60}{3.14 \times d \times N} \]

\[ F_r = \left( \frac{2 \times 27.13 \times 10^3}{81} \right) = 243.81 N \]

\[ F_r = F_a \]

\[ F_c = F_r \text{ton 20} \]

\[ F_c = 243.81 N \]

\[ F_c / F_r > e \]

For bearing no: SKF 6200

\[ C_o = 2240 N \]

\[ F_c / C_o = (670.8/2240) = 0.299 \]

\[ F_c / C_o = 0.299 \]

\[ F_c / F_r > e \]

\[ X = 0.56 \]

\[ Y = 1.1608 \]

\( S = \text{service factor} \)

\[ S = 1.3 \] [Rotary m/c with no impact]

\[ P = [0.56 \times 243.8 + 1.1608 \times 670.8] \times 1.3 \]

\[ P = 1189.75 N \]

\[ C = (L / L_{10})^{0.6} P \]

\[ C = (1 \times 10^7 / 1 \times 10^6)^{0.6} \times 1189.75 \]

\[ C = 2563.23 N \]

As dynamic load ratio for SKF 6200 bearing is \( c = 400 \text{ kgf} \)
The selected bearing SKF6200 is safe

4.4 DESIGN OF SHAFTS:

Shaft-engine shaft

\[ N_{\text{min}}=750 \text{ rpm} \]

\[ M_t = \frac{P_x \times 60}{2\pi} \text{ N} \]

\[ =1.3 \times 10^3 \times 60 / 2 \times \pi \times 750 \]

\[ =19.10 \times 10^3 \text{ Nmm} \]

\[ P_t = 2M_t / D \]

\[ = 2 \times 19.10 \times 10^3 / 38 \]

\[ = 1065.7 \text{ N} \]

\[ P_e = P_t / \cos 20 \]

\[ = 1069.7 \]

\[ M_b = \frac{P_t \times L}{4} = 1069.7 \times 10^3 / 4 \]

\[ = 26.742 \times 10^3 \text{ Nmm} \]

\[ M_{tq} = \sqrt{M_b^2 + M_t^2} \]

\[ = 32.86 \times 10^3 \text{ Nmm} \]

\[ T = 16M_t / \pi d^3 = 55 \]

\[ = 16 \times 32.86 \times 10^3 / \pi \times (10.03)^3 \]

\[ D = 14.49 \text{ mm} \]

\[ D = 16 \text{ mm} \]

\[ N_{\text{HW}} = 529 \text{ rpm} \]

\[ M_t = 27.09 \times 10^3 \text{ Nmm} \]

\[ P_e = [(2x 27.09 \times 103)] \]

\[ P_e = (P_t) / \cos 20 = 1067.7 \text{ N} \]

\[ M_b = (P_e \times L) / 4 = 26.09 \times 10^3 \text{ Nmm} \]

\[ M_{oc} = 38.031 \text{ Nmm} \]

5. FABRICATION PROCESS

The material for shaft and gear are taken as C 45 steel. The gears and the shafts are fabricated in the following method.

Gears

Machining, drilling and boring

These operations where done in gears at centre to produce hole in the gears to hold on the shaft.

Shafts

Turning-These operations are done in lathe for the shaft in which the cylindrical objects may be produced. With the work piece rotating and single point cutting tool

Welding-This sort of operation is done to fix the gears onto the shaft.

Assembly

After machining the components, they were assembled.

- At first, the gears are mounted on the shafts as a preliminary process the two dog clutches are mounted on the shaft. One in the input shaft and another in the output shaft.
- For the rigid support of gears on the spline shaft a bearing is provided over a dog clutch.
- The bearings are fixed to the mountings on the shaft.
- The gear shift lever is fixed, in the assembly for engaging gears.

Fig. 1 CAD Model of Six speed constant mesh Gearbox
CONCLUSION

Although there are much advancement in the field of designing and fabrication of gear boxes, the constant mesh gear box is one of the most efficient gear boxes. The Project was an exposure to the world of practical working knowledge. It gives us an opportunity to apply the theories studied in the curriculum in a practical situation. It also gave an opportunity to know the practical difficulties that arise in the process of designing and fabrication. A gear box can also be designed and fabricated for 4, 8, 12, 16, etc as per the requirement using the same principle and method.

FUTURE SCOPE OF THE PROJECT

The future scope of the project is by replacing the material of the components with a low weight and high strength materials. The dog clutch can be engaged or disengage by hydraulic or pneumatic systems with help of sensors. We can also reduce the number of gears and obtain the same number of speeds. The type of engagement between the dog clutch and the gear can also be improved by some other means.
