Abstract: The world is becoming unsafe for Humen in all aspects. The crimes against Humen are increasing at a higher rate. The employed Humen are feeling unsafe due to increasing crimes. This paper proposes a quick responding mechanism that helps Humen during trouble. When someone is going to harass, she can press the button that is attached to the device and the location information is sent as an SMS alert to few pre defined emergency numbers in terms of latitude and longitude. The microcontroller used is PIC16877A. It is interfaced with a push button, a GPS module, a GSM modem and a speech circuit (ISD1820PY). If the switch is pressed, it activates the speech circuit to capture the attention of the people nearby for help. The program is developed in embedded language to demonstrate the system capability in providing real time response. Thus the girl can be safe and she can feel protected.

Keywords: PIC16F877A; GPS; GSM; ISD 1820PY

INTRODUCTION

Even in this modern era Humen are feeling insecure to step out of their house because of increasing crimes in our country like harassment, abuse, violence etc. The corporate and IT sector are currently in boom. Many Humen are working in corporate even in night shifts. There is a feeling of insecurity among the working Humen. The proposed device is more like a safety system in case of emergency. This device can be fitted in a jacket (similar to a blazer for Humen). It is an easy to carry device with more features and functions. The emergency push button is held to one of the buttons of the jacket.

The main purpose of this device is to intimate the parents and police about the current location of the Humen. A GPS system is used to trace the current position of the victim and a GSM modem is used to send the message to the pre defined numbers. There are several applications that reduce the risk of sexual abuse by sending SMS but in our model we also provide an audio circuit which is more useful for physically challenged people. The block diagram of the proposed system is shown in Figure 1.

The microcontroller acts as an embedded computing system and it controls the activities of all the subsystems. The microcontroller is interfaced with all the other modules of the device. The program for PIC microcontroller is done in Embedded C language and is dumped using a kit.

Existing System

GSM and GPS based vehicle tracking system is currently used. This system consists of GPS module attached to a button in the vehicle. In case of emergency, the switch attached to the GPS can be pressed. The GPS that is used here is Teltonika FM1100 [1-3]. When any problem occurs the employee travelling in the vehicle presses the switch attached to the GPS. GSM module attached to this GPS and switch is used to send the message to a special team of the organization. Although this system seems to be efficient, at times there are some drawbacks because the drivers may not be trustworthy. Another existing method is an application based prototype [2]. It is interfaced with GPS, GSM and a spy camera. The user must register the emergency numbers. This is an android app which provides all facilities but it has a disadvantage that if the mobile phone of the victim is thrown away by the opposing person, this model cannot be used efficiently. To overcome these disadvantages we propose a model.

Proposed Model

The device consist of

- GSM(SIM 900A)
- GPS(G702-001UB)
The trigger button is pressed. The system controller. The pressing the button because it does not identify the end of the sentence. The voltage supply is about 3.4V which is supplied from the voltage regulator circuit.

**Features of SIM 900A**

- Low cost.
- RS 232/interface DB port.
- Voice communication port
- On board voltage regulator.
- Power /single led indication.
- SMA connector for antenna connection.
- This module can be easily interfaced with it AT commands over TTL interface.

**GPS**

It consists of six wires out of which three wires are used for connection. The blue wire is the transmitter wire which is connected to the 15th pin of the microcontroller. Voltage supply is about 3.3V to 5V. When trigger button is pressed, GPS starts receiving signals from 8 satellites out of the 24 satellites in the orbit [3]. Once if the connection is established the latitude and longitude values of the current location are obtained. The GPS acts as a transmitter. The 5V supply is given to the GPS from the microcontroller (Figure 2).

**Features of G702-001UB**

- Received bandwidth is about 1575.42MHz.
- 50 tracking channels are available.
- Accuracy in terms of time is about 1 us.
- The maximum altitude is about 18000 m.
- Maximum speed is about 500 m/s.
- Sensitivity of tracking is about 162dBm.
- Operating temperature is about 30 degree to 80degree.

**Speech circuit (ISD1820PY)**

The component used for speech circuit is ISD1820PY. The required sentence or a phrase can be recorded [2]. There are three buttons namely REC, PLAYE, PLAYL. The REC button is used as an input button because it is used to record the required sentence or a phrase. The required input sentence is recorded with the help of MIC when the REC button is enabled. If the PLAYE button is pressed then the recorded sentence is continuously played. When the PLAYL is pressed the sentence is heard only up to the time of pressing the button because it does not identify the end of the sentence. The voltage supply is given from the microcontroller. Further two connections are given to the speaker through which sound is heard (Figure 3).

**Features of ISD1820PY**

- Playback can be edge or level activated.
- Automatic power down mode is available.
- We can drive a 8 ohm speaker.
- Voltage supply varies about 3V to 5V.
The audio of about 20 seconds can be recorded.
Dimensions: 37 × 55 mm.

Applications of the Proposed Device
• Can be used as a legal evidence of crime with exact location information for prosecution.

Advantages of the Proposed Device
• Can be used for the safety of women.
• Can be used for the safety of children.
• Can be used for the safety of elderly aged people.
• Can be used for the safety of physically challenged people.

CONCLUSION

Being safe and secure is the demand of the day. Our effort behind this project is to design and fabricate a gadget which is so compact in itself that provide advantage of personal security system. This design will deal with most of the critical issues faced by women and will help them to be secure. Existing systems provide the mechanism to track the vehicle but no other emergency mechanism is proposed. The proposed mechanism provides viewing the location of the victim in terms of latitude and longitude which can further be tracked using Google maps. This system helps to decrease the crime rate against Humen. Humen’s security is a critical issue in current situation. These crimes can be brought to an end with the help of real time implementation of our proposed system.
