Abstract—Modern embedded control systems require high performance digital devices to answer their growing complexities. The high of FPGA has made it an appropriate solution for motor drive application. This paper presents a speed control strategy for a three phase induction motor. Firstly the induction machine is mathematically modeled and the transformation is with respect to rotor flux. Secondly a matlab/simulink model is designed and developed based on the principle of vector control. Thirdly the induction motor is fed from a three hose inverter bridge. The triggering pulses required for the inverter are generated using state vector pulse width modulation technique. The svpwm is realized on the same chip. Finally the developed model is simulated using matlab.

Keywords—IVOC- Indirect Vector oriented control, FPGA- Field Programmable Gate Array, State Vector PWM, MPSOC-Multi Process System On Chip.

I. INTRODUCTION

In the last years, several research studies proved that FPGA is an appropriate alternative to implement digital controllers in several application areas, such as motion control, power electronics, and motor control over pure software solutions and analog solutions Control of AC induction machines using the vector control techniques is becoming more popular nowadays. The objective of vector control of induction machine is to allow an induction machine to be controlled just like a separately excited dc machine. When the dynamic equations for an induction machine is transformed by means of rotating transformation methods into a reference frame that coincides with rotor flux, the results become similar to that of a DC machine. This allows AC machine to be controlled just like a DC machine. This method of decoupling the variables and controlling them independently is termed as vector control. The Pulse Width Modulation (PWM) Technique called “Vector Modulation”, which is based on space vector theory, is the most important development in the last few years. Although, several of PWM methods have been created in the past, the vector modulation technique appears to be the best alternative for a three phase switching power converter. Since the concept of multilevel PWM converter was introduced, various modulation strategies have been developed and studied in detail, such as multilevel sinusoidal PWM, multilevel selective harmonic elimination and space vector modulation. Among these strategies, the space vector PWM (SVPWM) [14][15] stands out because it offers significant flexibility to optimize switching waveforms and is well suited for digital implementation. The IVOC with space vector pwm controller is modeled in matlab/simulink and the simulation result is presented in this paper.

II. MATHEMATICAL MODEL OF THREE PHASE INDUCTION MOTOR

Induction machine modeling has continuously attracted the attentions of researchers not only because such machines are made and used in larger numbers i.e. (80% of all the loads), but also due to their varied modes of operation both under steady state and dynamic state. The basic purpose of using d-q model[13][6] approach to control the motor parameters independently i.e. torque and flux of the induction motor. By this modeling approach, all of the machine parameters are assessable for control and verification purposes. As long as equations are known, any drive or control algorithm can be modeled in Simulink.

A. D-Q Modelling of Three Phase Induction Motor

The induction machine d-q or dynamic equivalent circuit is shown in Fig. 1 & 2. The modeling equations are as given below.

Stator voltage equations[6][8][13]

\[ V_{qi} = R_s i_{qi} + \frac{d\psi_{qi}}{dt} + \omega \psi_{di} \]  

(1)

Fig. 1 Quadrature Axis Equivalent Circuit

Fig. 1 Direct Axis Equivalent Circuit
\[ V_{ds} = R_s i_s + \frac{d\psi_d}{dt} + \omega \psi_q \]  
(2)

Rotor voltage equations[6][8][13]

\[ V_{dq} = R_r i_q + \frac{d\psi_q}{dt} + (\omega_e - \omega_r) \psi_d \]  
(3)

\[ V_{dr} = R_r i_d + \frac{d\psi_d}{dt} + (\omega_e - \omega_r) \psi_q \]  
(4)

Stator flux equations[6][8][13]

\[ \psi_{qs} = L_s i_{qs} + L_m i_{qr} \]  
(5)

\[ \psi_{ds} = L_s i_{ds} + L_m i_{dr} \]  
(6)

Rotor flux equation[6][8][13]

\[ \psi_{qr} = L_r i_{qr} + L_m i_{qs} \]  
(7)

\[ \psi_{dr} = L_r i_{dr} + L_m i_{ds} \]  
(8)

Stator current equations[6][8][13]

\[ i_{ds} = \frac{1}{X_s} (\psi_{ds} - \psi_{ms}) \]  
(9)

\[ i_{qs} = \frac{1}{X_s} (\psi_{qs} - \psi_{mq}) \]  
(10)

Rotor current equation[6][8][13]

\[ i_{dr} = \frac{1}{X_s} (\psi_{dr} - \psi_{md}) \]  
(11)

\[ i_{qr} = \frac{1}{X_s} (\psi_{qr} - \psi_{mq}) \]  
(12)

Torque equation[6][8][13]

\[ T_e = 1.5P \left( \psi_{ds} i_{qs} - \psi_{qs} i_{ds} \right) \]  
(13)

\[ T_c - T_L = J \left( \frac{d\omega}{dt} \right) \]  
(14)

\[ \frac{d\omega}{dt} = \frac{P}{2J} (T_c - T_L) \]  
(15)

Where

d: direct axis
q: quadrature axis
s: stator variable
r: rotor variable
\( \omega_s \): stator angular electrical frequency,
\( \omega_r \): rotor angular electrical speed.
\( \psi_i \): is the flux linkage \((i=q \text{ or } d \text{ and } j=s \text{ or } r)\).
P: number of poles,
J: moment of inertia,
Te: electrical output torque,
TL (or Tl): load torque.

III. BLOCK DIAGRAM OF IVOC

Fig.3 shows the block diagram of an indirect vector control system for an induction motor. The dq frame is fixed to the rotor flux position which is defined by the angle. The rotor position is sensed by a position detector and used in conversion from dq to abc. The induction motor is fed by a current-controlled three phase inverter bridge. The stator currents are regulated by state vector pulse width modulation technique which generates inverter drive signals for the inverter switches.

IV. DEVELOPMENT OF IVOC SIMULINK MODEL

The simulink model developed as shown in the fig below. In this system, rotor reference frame is chosen as the reference frame for transforming the dynamic equations of the induction motor. The induction motor is fed by a current-controlled three phase inverter bridge. The stator currents are regulated by ssvpwm which generate drive signals for the inverter switches which is converted to Sa, Sb, and Sc. The torque is controlled by the quadrature-axis component of the stator current \( i_{qs} \). The rotor flux is controlled by the direct-axis component \( i_{ds} \). The motor speed is regulated by a control loop which produces the torque control signal \( i_{qs} \). The \( i_{qs} \) and \( i_{ds} \) current references are converted into phase current references \( i_a^* \), \( i_b^* \), and \( i_c^* \) for the current regulators.

A) Simulink model of IVOC:
B) Description of individual processes

**Process - 1**

**abcto αβ transformation (Clarke’s transformation):**

The transformation of three phase to two is done using clarks and parks transformation. The transformation equations are implemented in the abc to dq conversion block and the equations are as below

\[
\alpha = \frac{2}{3} (t_a - \frac{1}{2} t_b - \frac{1}{2} t_c)
\]

\[
\beta = \frac{2}{3} (2 \sqrt{3} t_a - \sqrt{3} t_b - \sqrt{3} t_c)
\]

**αβ to dq axes (Parks transformation)**

\[
\alpha = t_x \cos \theta + t_y \sin \theta
\]

\[
\beta = t_x \sin \theta + t_y \cos \theta
\]

**Process - 2**

**F_{r} (flux) calculation:**

\[
F_{r} = i_d L_m R_f \left( \frac{1}{L_{eq} + R_{r}} \right)
\]

\[
\Theta = \int (\omega_m + \omega_{el}) dt
\]

\[
\omega_{el} = \frac{L_m R_f}{\psi_f L_r} i_p
\]

**Process - 3**

**Speed controller block**

In the speed controller block PI controller is implemented and the reference torque is calculated by implementing the torque equation given below

\[
T_{e}^* = (K_p (\omega^* - \omega) + K_I (\omega^* - \omega))
\]

\[
i_q^* = \left( \frac{2}{3} \right) \left( \frac{2}{3} \right) \left( L_r \omega^* \right) \left( \frac{T_e}{\phi r} \right)
\]

\[
i_d^* = \left( \frac{\phi r}{L_m} \right)
\]

**Process - 4**

**Fig: 8 Process 4**

**Sub blocks of process – 4**

**Fig: 8.1 Sublocks of process 5**

**Fig: 8.1.1 estimation of V_{sq}**
\[ v_{sd} = R_s i_{sd} + \omega L_s i_{sd} \tag{28} \]
\[ v_{sd}^* = R_s i_{sd}^* + \sigma L_s \frac{di_{sd}^*}{dt} + \omega L_s i_{sd}^* \tag{28.1} \]
\[ v_{dq} \rightarrow v_{abc} \text{ transformation block:} \]

The two phase to three phase conversion is obtained using Clark and Park's transformation. The equations are as given below.

\[ v_{dq} \rightarrow v_{abc} \text{ transformation:} \]

\[ v_\alpha = v_d \cos \theta - v_q \sin \theta \]
\[ v_\beta = \sin \theta + v_d \cos \theta \]

**d-q to a\beta transformation:**

\[ v_\alpha = v_a \sqrt{\frac{2}{3}} \tag{30} \]
\[ v_\beta = \sqrt{\frac{2}{3}} \left( -\frac{1}{2} v_a + \frac{\sqrt{3}}{2} v_b \right) \tag{31} \]
\[ v_\gamma = \sqrt{\frac{2}{3}} \left( -\frac{1}{2} v_a - \frac{\sqrt{3}}{2} v_b \right) \tag{32} \]

**Three phase inverter:**

\[ v_\alpha = v_a \sqrt{\frac{2}{3}} \tag{30} \]
\[ v_\beta = \sqrt{\frac{2}{3}} \left( -\frac{1}{2} v_a + \frac{\sqrt{3}}{2} v_b \right) \tag{31} \]
\[ v_\gamma = \sqrt{\frac{2}{3}} \left( -\frac{1}{2} v_a - \frac{\sqrt{3}}{2} v_b \right) \tag{32} \]
Induction motor d-q block:

\[ \begin{align*}
\ell_a &= \ell_d \\
\ell_b &= \frac{1}{2} \ell_d + \frac{\sqrt{3}}{2} \ell_a \\
\ell_c &= \frac{1}{2} \ell_d + \frac{\sqrt{3}}{2} \ell_a \\
\tau_a &= \frac{3}{2} \left( \frac{P}{\omega} \right) \left( F_{\alpha} \ell_d - F_{\alpha} \ell_d \right) \\
\omega &= [I C T e - T d] \left( \frac{\dot{P}}{\tau} \right)
\end{align*} \] (33)

Fig. 12 Induction motor dq block

C) Principle of SVPWM:

In vector coordinates, the combinations of three-phase inverter output voltages form eight space vectors as depicted in figure 5. There are six nonzero space vector forming an origin centered hexagon, and the circle is the maximum trajectory of the regular sinusoidal outputs in linear modulation. This figure also illustrates the PWM output patterns in the six regions (denoted as sector I-VI) separately. In accordance with three phase to two phase transformation, the three phase inputs \((V_a, V_b, V_c)\) are transformed into \((V_\alpha, V_\beta)\) as the reference vectors.
