**Abstract** - In this paper a new class of functions called contra  $sb\hat{g}$ -continuous function is introduced and its properties are studied. Some characterization and several properties concerning Contra  $sb\hat{g}$ -continuity are obtained. Also, Contra  $sb\hat{g}$ -irresolute function and Perfectly Contra  $sb\hat{g}$ -irresolute function are introduced.

**Keywords:**  $sb\hat{g}$ -closed sets,  $sb\hat{g}$ -continuous, Contra  $sb\hat{g}$ -continuous, Contra  $sb\hat{g}$ -irresolute.

**AMS Mathematics Subject Classification :** 54C08, 54C10.

## 1. INTRODUCTION

In 1996, Dontchev[7] introduced and investigated a new notion of continuity called contra – continuity. Following this, many authors introduced various types of new generalizations of contra continuity called as contra  $\alpha$ -continuity, contra semi-continuity[3], contra b-continuity[12], contra sg-continuity[5], contra gs-continuity[5], contra gb-continuity[16], contra  $g^*b$ -continuity[16], contra  $b\hat{g}$ -continuity[15] and so on and they investigated their properties. In 2015, we introduced  $sb\hat{g}$ -closed sets[3] in Topological spaces.

In this paper, we introduce and investigate some of the properties of contra  $sb\hat{g}$ -continuous, contra  $sb\hat{g}$ -irresolute functions and we obtain some of its characterization.

## 2. PRELIMINARIES

Throughout this paper  $(X, \tau)$  (or simply  $X$ ) represents topological spaces on which no separation axioms are assumed unless otherwise mentioned. For a subset  $A$  of  $(X, \tau)$ ,  $Cl(A)$ ,  $Int(A)$  and  $A^c$  denote the closure of  $A$ , interior of  $A$  and the complement of  $A$  respectively. We are giving some definitions.

**Definition 2.1:** A subset  $A$  of a topological space  $(X, \tau)$  is called

1. a semi-open set[5] if  $A \subseteq Cl(Int(A))$ .
2. an  $\alpha$ -open set[8] if  $A \subseteq Int(Cl(Int(A)))$ .
3. a b-open set[1] if  $A \subseteq Cl(Int(A)) \cup Int(Cl(A))$ .
4. a regular open[14] set if  $A = Int(Cl(A))$ .

The complement of a semi-open (resp.  $\alpha$ -open, b-open, regular-open) set is called semi-closed (resp.  $\alpha$ -closed, b-closed, regular-closed) set.

The intersection of all semi-closed (resp.  $\alpha$ -closed, b-closed, regular-closed) sets of  $X$  containing  $A$  is called the semi-closure (resp.  $\alpha$ -closure, b-closure, regular closure) of  $A$  and is denoted by  $sCl(A)$  (resp.  $\alpha Cl(A)$ ,  $bCl(A)$ ,  $rCl(A)$ ). The family of all semi-open (resp.  $\alpha$ -open, b-open, regular-open) subsets of a space  $X$  is denoted by  $SO(X)$  (resp.  $\alpha O(X)$ ,  $bO(X)$ ,  $rO(X)$ ).

**Definition 2.2:** A subset  $A$  of a topological space  $(X, \tau)$  is called a

- 1) a sg-closed set[5] if  $sCl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is semi-open in  $X$ .
- 2) a gs-closed set[5] if  $sCl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $X$ .
- 3) a gb-closed set[16] if  $bCl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $X$ .
- 4) a  $g^*b$ -closed set[16] if  $bCl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $g$ -open in  $X$ .
- 5) a  $b\hat{g}$ -closed set[15] if  $bCl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\hat{g}$ -open in  $X$ .
- 6) a  $sb\hat{g}$ -closed set[3] if  $sCl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $b\hat{g}$ -open in  $X$ .

The complement of a sg-closed (resp. gs-closed, gb-closed,  $g^*b$ -closed and  $b\hat{g}$ -closed) set is called sg-open (resp. gs-open, gb-open,  $g^*b$ -open and  $b\hat{g}$ -open) set.

**Definition 2.3:** A space  $(X, \tau)$  is called a

- i.  $T_{sb\hat{g}}$  – space[3] if every  $sb\hat{g}$ -closed set in  $X$  is closed.
- ii.  $T_{sb\hat{g}}^\alpha$  – space[3] if every  $sb\hat{g}$ -closed set in  $X$  is  $\alpha$ -closed.

**Definition 2.4:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called a

- i.  $sb\hat{g}$  – continuous map[4] if  $f^{-1}(V)$  is  $sb\hat{g}$ -closed in  $(X, \tau)$  for every closed set  $V$  in  $(Y, \sigma)$ .
- ii.  $sb\hat{g}$  – irresolute map[4] if  $f^{-1}(V)$  is  $sb\hat{g}$ -closed in  $(X, \tau)$  for every closed set  $V$  in  $(Y, \sigma)$ .

**Definition 2.5:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called a

- i. Contra continuous map[7] if  $f^{-1}(V)$  is closed in  $(X, \tau)$  for every open set  $V$  in  $(Y, \sigma)$ .

- ii. Contra semi-continuous map[6] if  $f^{-1}(V)$  is semi-closed in  $(X, \tau)$  for every open set  $V$  in  $(Y, \sigma)$ .
- iii. Contra  $\alpha$ -continuous map[8] if  $f^{-1}(V)$  is  $\alpha$ -closed in  $(X, \tau)$  for every open set  $V$  in  $(Y, \sigma)$ .
- iv. Contra b-continuous map[15] if  $f^{-1}(V)$  is b-closed in  $(X, \tau)$  for every open set  $V$  in  $(Y, \sigma)$ .
- v. Contra sg-continuous map[5] if  $f^{-1}(V)$  is sg-closed in  $(X, \tau)$  for every open set  $V$  in  $(Y, \sigma)$ .
- vi. Contra gs-continuous map[5] if  $f^{-1}(V)$  is gs-closed in  $(X, \tau)$  for every open set  $V$  in  $(Y, \sigma)$ .
- vii. Contra gb-continuous map[16] if  $f^{-1}(V)$  is gb-closed in  $(X, \tau)$  for every open set  $V$  in  $(Y, \sigma)$ .
- viii. Contra  $g^*b$ -continuous map[16] if  $f^{-1}(V)$  is  $g^*b$ -closed in  $(X, \tau)$  for every open set  $V$  in  $(Y, \sigma)$ .
- ix. Contra  $b\hat{g}$ -continuous map[15] if  $f^{-1}(V)$  is  $b\hat{g}$ -closed in  $(X, \tau)$  for every open set  $V$  in  $(Y, \sigma)$ .

Definition 2.6:[15] A space  $(X, \tau)$  is said to be locally indiscrete if every open subset of  $X$  is closed in  $X$ .

Definition 2.7:[5] A topological space  $(X, \tau)$  is said to be Urysohn space if for each pair of distinct points  $x$  and  $y$  in  $X$ , there exists two open sets  $U$  and  $V$  in  $X$  such that  $x \in U$ ,  $y \in V$  and  $\text{Cl}(U) \cap \text{Cl}(V) = \emptyset$ .

Definition 2.8:[5] For a map  $f: X \rightarrow Y$ , the subset  $\{(x, f(x)) : x \in X\} \subset X \times Y$  is called the graph of  $f$  and is denoted by  $G(f)$ .

### 3. CONTRA $sb\hat{g}$ -CONTINUOUS FUNCTIONS

We introduce the following definition.

Definition 3.1: A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called Contra  $sb\hat{g}$ -continuous if  $f^{-1}(V)$  is  $sb\hat{g}$ -closed in  $(X, \tau)$  for every open set  $V$  in  $(Y, \sigma)$ .

Example 3.2: Let  $X = Y = \{a, b, c\}$  with topologies  $\tau = \{X, \emptyset, \{a\}, \{b\}, \{a, b\}\}$  and  $\sigma = \{Y, \emptyset, \{a\}, \{a, b\}\}$ . Define a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = a$ ,  $f(b) = c$ ,  $f(c) = b$ .

$$sb\hat{g} - C(X) = \{X, \emptyset, \{a\}, \{b\}, \{c\}, \{a, c\}, \{b, c\}\}$$

Here, the inverse image of open sets  $\{a\}$  and  $\{a, b\}$  in  $Y$  are  $\{a\}$  and  $\{a, c\}$  respectively which are  $sb\hat{g}$ -closed sets in  $X$ . Hence,  $f$  is contra  $sb\hat{g}$ -continuous.

Theorem 3.3:

- a) Every contra continuous function is contra  $sb\hat{g}$ -continuous function.
- b) Every contra  $\alpha$ -continuous function is contra  $sb\hat{g}$ -continuous function.

Proof:

- a) Let  $V$  be any open set in  $(Y, \sigma)$ . Since  $f$  is contra continuous,  $f^{-1}(V)$  is closed in  $(X, \tau)$ . By Proposition 3.4 in [3],  $f^{-1}(V)$  is  $sb\hat{g}$ -closed in  $(X, \tau)$ . Hence,  $f$  is contra  $sb\hat{g}$ -continuous function.
- b) Let  $V$  be any open set in  $(Y, \sigma)$ . Since  $f$  is contra  $\alpha$ -continuous,  $f^{-1}(V)$  is  $\alpha$ -closed in  $(X, \tau)$ . By

Proposition 3.7 in [3],  $f^{-1}(V)$  is  $sb\hat{g}$ -closed in  $(X, \tau)$ . Hence,  $f$  is contra  $sb\hat{g}$ -continuous function.

The following examples show that the converse of the above proposition need not be true.

Example 3.4:

a) Let  $X = Y = \{a, b, c\}$  with topologies  $\tau = \{X, \emptyset, \{a\}, \{b\}, \{a, b\}\}$  and  $\sigma = \{Y, \emptyset, \{a\}, \{b, c\}\}$ . Define a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = a$ ,  $f(b) = b$ ,  $f(c) = c$ .

$$sb\hat{g} - C(X) = \{X, \emptyset, \{a\}, \{b\}, \{c\}, \{a, c\}, \{b, c\}\}$$

$$C(X) = \{X, \emptyset, \{c\}, \{a, c\}, \{b, c\}\}$$

Here the inverse image of an open set  $\{a\}$  in  $(Y, \sigma)$  is  $\{a\}$  which is  $sb\hat{g}$ -closed but not closed in  $(X, \tau)$ . Hence,  $f$  is contra  $sb\hat{g}$ -continuous but not contra continuous.

b) Let  $X = Y = \{a, b, c\}$  with topologies  $\tau = \{X, \emptyset, \{a\}, \{c\}, \{a, c\}, \{b, c\}\}$  and  $\sigma = \{Y, \emptyset, \{b\}\}$ . Define a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = a$ ,  $f(b) = b$ ,  $f(c) = c$ .

$$sb\hat{g} - C(X) = \{X, \emptyset, \{a\}, \{b\}, \{a, b\}, \{b, c\}\}$$

$$\alpha - C(X) = \{X, \emptyset, \{a\}, \{a, b\}, \{b, c\}\}$$

Here the inverse image of an open set  $\{b\}$  in  $(Y, \sigma)$  is  $\{b\}$  which is  $sb\hat{g}$ -closed but not  $\alpha$ -closed in  $(X, \tau)$ . Hence,  $f$  is contra  $sb\hat{g}$ -continuous but not contra  $\alpha$ -continuous.

Theorem 3.5:

- a) Every contra  $sb\hat{g}$ -continuous function is contra b-continuous function
- b) Every contra  $sb\hat{g}$ -continuous function is contra sg-continuous function
- c) Every contra  $sb\hat{g}$ -continuous function is contra gs-continuous function
- d) Every contra  $sb\hat{g}$ -continuous function is contra gb-continuous function
- e) Every contra  $sb\hat{g}$ -continuous function is contra  $g^*b$ -continuous function
- f) Every contra  $sb\hat{g}$ -continuous function is contra  $b\hat{g}$ -continuous function.

Proof:

- a) Let  $V$  be any open set in  $(Y, \sigma)$ . Since  $f$  is contra  $sb\hat{g}$ -continuous,  $f^{-1}(V)$  is  $sb\hat{g}$ -closed in  $(X, \tau)$ . By Proposition 3.11 in [3],  $f^{-1}(V)$  is b-closed in  $(X, \tau)$ . Hence,  $f$  is contra b-continuous function.
- b) Let  $V$  be any open set in  $(Y, \sigma)$ . Since  $f$  is contra  $sb\hat{g}$ -continuous,  $f^{-1}(V)$  is  $sb\hat{g}$ -closed in  $(X, \tau)$ . By Proposition 3.13 in [3],  $f^{-1}(V)$  is sg-closed in  $(X, \tau)$ . Hence,  $f$  is contra sg-continuous function.
- c) Let  $V$  be any open set in  $(Y, \sigma)$ . Since  $f$  is contra  $sb\hat{g}$ -continuous,  $f^{-1}(V)$  is  $sb\hat{g}$ -closed in  $(X, \tau)$ . By Proposition 3.15 in [3],  $f^{-1}(V)$  is gs-closed in  $(X, \tau)$ . Hence,  $f$  is contra gs-continuous function.
- d) Let  $V$  be any open set in  $(Y, \sigma)$ . Since  $f$  is contra  $sb\hat{g}$ -continuous,  $f^{-1}(V)$  is  $sb\hat{g}$ -closed in  $(X, \tau)$ . By

Proposition 3.17 in [3],  $f^{-1}(V)$  is gb-closed in  $(X, \tau)$ . Hence,  $f$  is contra gb-continuous function.

- e) Let  $V$  be any open set in  $(Y, \sigma)$ . Since  $f$  is contra sbg-continuous,  $f^{-1}(V)$  is sbg-closed in  $(X, \tau)$ . By Proposition 3.21 in [3],  $f^{-1}(V)$  is  $g^*b$ -closed in  $(X, \tau)$ . Hence,  $f$  is contra  $g^*b$ -continuous function.
- f) Let  $V$  be any open set in  $(Y, \sigma)$ . Since  $f$  is contra sbg-continuous,  $f^{-1}(V)$  is sbg-closed in  $(X, \tau)$ . By Proposition 3.23 in [3],  $f^{-1}(V)$  is bg-closed in  $(X, \tau)$ . Hence,  $f$  is contra bg-continuous function.

The converse of the above theorem need not be true as shown in the following example.

Example 3.6:

a) Let  $X = Y = \{a, b, c\}$  with topologies  $\tau = \{X, \phi, \{a, b\}, \{c\}\}$  and  $\sigma = \{Y, \phi, \{a\}, \{a, b\}\}$ . Define a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = a, f(b) = b, f(c) = c$ .

$$sb\hat{g} - C(X) = \{X, \phi, \{c\}, \{a, b\}\}$$

$$b - C(X) = \{X, \phi, \{a\}, \{b\}, \{c\}, \{a, b\}, \{a, c\}, \{b, c\}\}$$

Here the inverse image of an open set  $\{a\}$  in  $(Y, \sigma)$  is  $\{a\}$  which is b-closed but not sbg-closed in  $(X, \tau)$ . Hence,  $f$  is contra b-continuous but not contra sbg-continuous.

b) Let  $X = Y = \{a, b, c\}$  with topologies  $\tau = \{X, \phi, \{a\}, \{b, c\}\}$  and  $\sigma = \{Y, \phi, \{a\}, \{a, b\}, \{a, c\}\}$ . Define a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = a, f(b) = b, f(c) = c$ .

$$sb\hat{g} - C(X) = \{X, \phi, \{a\}, \{b, c\}\}$$

$$sg - C(X) = \{X, \phi, \{a\}, \{b\}, \{c\}, \{a, b\}, \{a, c\}, \{b, c\}\}$$

Here the inverse image of the open sets  $\{a, b\}$  and  $\{a, c\}$  in  $(Y, \sigma)$  are  $\{a, b\}$  and  $\{a, c\}$  which are sg-closed but not sbg-closed in  $(X, \tau)$ . Hence,  $f$  is contra sg-continuous but not contra sbg-continuous function.

c) Let  $X = Y = \{a, b, c, d\}$  with topologies  $\tau = \{X, \phi, \{a\}, \{a, c\}, \{a, b, d\}\}$  and  $\sigma = \{Y, \phi, \{b\}, \{a, b\}, \{b, c, d\}\}$

Define a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = d, f(b) = b, f(c) = c, f(d) = a$ .

$$sb\hat{g} - C(X) = \{X, \phi, \{b\}, \{c\}, \{d\}, \{b, c\}, \{c, d\}, \{b, d\}, \{b, c, d\}\}$$

$$gs - C(X) = \{X, \phi, \{b\}, \{c\}, \{d\}, \{b, c\}, \{c, d\}, \{b, d\}, \{a, b, c\}, \{a, c, d\}, \{b, c, d\}\}$$

$$\{a, b, c\}, \{a, c, d\}, \{b, c, d\}\}$$

Here the inverse image of an open set  $\{b, c, d\}$  in  $(Y, \sigma)$  is  $\{a, b, c\}$  which is gs-closed set but not sbg-closed set in  $(X, \tau)$ . Hence,  $f$  is contra gs-continuous but not contra sbg-continuous function.

d) Let  $X = Y = \{a, b, c, d\}$  with topologies

$$\tau = \{X, \phi, \{a\}, \{a, c\}, \{a, b, d\}\} \text{ and } \sigma = \{Y, \phi, \{b\}, \{a, b\}, \{b, c, d\}\}$$

Define a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = c, f(b) = b, f(c) = a, f(d) = d$ .

$$sb\hat{g} - C(X) = \{X, \phi, \{b\}, \{c\}, \{d\}, \{b, c\}, \{c, d\}, \{b, d\}, \{b, c, d\}\}$$

$$gb - C(X) = \{X, \phi, \{b\}, \{c\}, \{d\}, \{b, c\}, \{c, d\}, \{b, d\}, \{a, b, c\}, \{a, c, d\}, \{b, c, d\}, \{a, b, d\}\}$$

$$\{a, b, c\}, \{a, c, d\}, \{b, c, d\}, \{a, b, d\}\}$$

Here the inverse image of an open set  $\{b, c, d\}$  in  $(Y, \sigma)$  is  $\{a, b, d\}$  which is gb-closed but not sbg-closed in  $(X, \tau)$ . Hence,  $f$  is contra gb-continuous but not contra sbg-continuous.

e) Let  $X = Y = \{a, b, c\}$  with topologies

$$\tau = \{X, \phi, \{a, c\}\} \text{ and } \sigma = \{Y, \phi, \{a\}, \{a, b\}, \{a, c\}\}$$

Define a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = b, f(b) = a, f(c) = c$ .

$$sb\hat{g} - C(X) = \{X, \phi, \{b\}\}$$

$$gb - C(X) = \{X, \phi, \{a\}, \{b\}, \{c\}, \{a, b\}, \{b, c\}\}$$

Here the inverse image of the open sets  $\{a, b\}$  and  $\{a, c\}$  in  $(Y, \sigma)$  are  $\{a, b\}$  and  $\{b, c\}$  which are  $g^*b$ -closed but not sbg-closed in  $(X, \tau)$ . Hence,  $f$  is contra  $g^*b$ -continuous but not contra sbg-continuous.

f) Let  $X = Y = \{a, b, c, d\}$  with topologies

$$\tau = \{X, \phi, \{b\}, \{a, b\}, \{b, c, d\}\} \text{ and } \sigma = \{Y, \phi, \{a\}, \{a, c\}, \{a, b, d\}\}$$

Define a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = a, f(b) = b, f(c) = c, f(d) = d$ .

$$sb\hat{g} - C(X) = \{X, \phi, \{a\}, \{c\}, \{d\}, \{a, c\}, \{a, d\}, \{c, d\}, \{a, c, d\}\}$$

$$b\hat{g} - C(X) = \{X, \phi, \{a\}, \{c\}, \{d\}, \{c, d\}, \{a, d\}, \{a, c\}, \{a, b, c\}, \{a, c, d\}, \{a, b, d\}\}$$

$$\{a, b, c\}, \{a, c, d\}, \{a, b, d\}\}$$

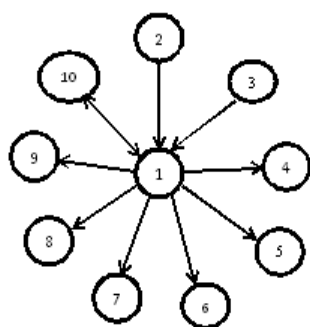

Here the inverse image of an open set  $\{a, b, d\}$  in  $(Y, \sigma)$  is  $\{a, b, d\}$  which is bg-closed but not sbg-closed in  $(X, \tau)$ . Hence,  $f$  is contra bg-continuous but not contra sbg-continuous.

Theorem 3.7: If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is contra semi-continuous function if and only if  $f$  is contra sbg-continuous function.

Proof: Let  $V$  be any open set in  $(Y, \sigma)$ . Since  $f$  is contra semi-continuous,  $f^{-1}(V)$  is semi-closed in  $(X, \tau)$ . Since from Proposition 3.6 in [3],  $f^{-1}(V)$  is sbg-closed in  $(X, \tau)$ . Hence,  $f$  is contra sbg-continuous.

Conversely, Let  $V$  be any open set in  $(Y, \sigma)$ . Since  $f$  is contra sbg-continuous,  $f^{-1}(V)$  is sbg-closed in  $(X, \tau)$ . Since from Proposition 3.6 in [3],  $f^{-1}(V)$  is semi-closed in  $(X, \tau)$ . Hence,  $f$  is contra semi-continuous.

Remark 3.8: The following diagram shows the relationships of contra sbg-continuous function with other known existing functions.

1. Contra sbg-continuous
2. Contra continuous
3. Contra  $\alpha$ -continuous
4. Contra b-continuous
5. Contra sg-continuous
6. Contra gs-continuous
7. Contra gb-continuous
8. Contra  $g^*b$ continuous
9. Contra b $\hat{g}$ -continuous

Theorem 3.9: The following are equivalent for a function  $f: (X, \tau) \rightarrow (Y, \sigma)$ ,

- a.  $f$  is contra sbg-continuous function
- b. For every closed subset  $F$  of  $Y$ ,  $f^{-1}(F)$  is sbg-open in  $X$
- c. For each  $x \in X$  and each closed subset  $F$  of  $Y$  with  $f(x) \in F$  there exists a sbg-open set  $U$  of  $X$  with  $x \in U$ ,  $f(U) \subseteq F$ .

Proof:

(a)  $\implies$  (b):

Let  $F$  be any closed set in  $Y$ . Then  $F^c$  is an open set in  $Y$ . Since  $f$  is contra sbg-continuous,  $f^{-1}(F^c)$  is sbg-closed set in  $X$ . Then  $[f^{-1}(F)]^c$  is sbg-closed set in  $X$ . Therefore  $f^{-1}(F)$  is sbg-open in  $X$ .

(b)  $\implies$  (a):

Let  $F$  be an open set in  $Y$ . Then  $F^c$  is closed set in  $Y$ . By (b),  $f^{-1}(F^c)$  is sbg-open set in  $X$ . Then  $[f^{-1}(F)]^c$  is sbg-open set in  $X$ . So  $f^{-1}(F)$  is sbg-closed set in  $X$ . Therefore,  $f$  is contra sbg-continuous function

(b)  $\implies$  (c):

Let  $F$  be any closed subset of  $Y$  and let  $f(x) \in F$  where  $x \in X$ . Then by (b),  $f^{-1}(F)$  is sbg-open in  $X$ . Also,  $x \in f^{-1}(F)$ . Take  $U = f^{-1}(F)$ . Then  $U$  is a sbg-open set containing  $x$  and  $f(U) \subseteq F$ .

(c)  $\implies$  (b):

Let  $F$  be any closed subset of  $Y$ . If  $x \in f^{-1}(F)$  then  $f(x) \in F$ . By (c), there exists a sbg-open set  $U_x$  of  $X$  with  $x \in U_x$  such that  $f(U_x) \subseteq F$ . Then  $f^{-1}(F) = \bigcup \{ U_x : x \in f^{-1}(F) \}$ . Hence,  $f^{-1}(F)$  is sbg-open in  $X$ .

Theorem 3.10: If  $X$  is  $T_{sbg}$ -space, then for the function  $f: (X, \tau) \rightarrow (Y, \sigma)$ , the following statements are equivalent.

- i.  $f$  is contra continuous function
- ii.  $f$  is contra sbg-continuous function.

Proof:

(i)  $\implies$  (ii):

Let  $V$  be any open set in  $Y$ . Since  $f$  is contra continuous,  $f^{-1}(V)$  is closed in  $X$ . From [3] proposition 3.4,  $f^{-1}(V)$  is sbg-closed in  $X$ . Therefore,  $f$  is contra sbg-continuous.

(ii)  $\implies$  (i):

Let  $V$  be any open set in  $Y$ . Since  $f$  is contra sbg-continuous,  $f^{-1}(V)$  is sbg-closed in  $X$ . Also, Since  $X$  is  $T_{sbg}$ -space,  $f^{-1}(V)$  is closed in  $X$ . Therefore,  $f$  is contra continuous.

Theorem 3.11: If a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is contra sbg-continuous and  $X$  is  $T_{sbg}^\alpha$ -space, then  $f$  is contra  $\alpha$ -continuous.

Proof: Let  $V$  be any open set in  $Y$ . Since  $f$  is contra sbg-continuous,  $f^{-1}(V)$  is sbg-closed in  $X$ . Also, Since  $X$  is  $T_{sbg}^\alpha$ -space,  $f^{-1}(V)$  is  $\alpha$ -closed in  $X$ . Therefore,  $f$  is contra  $\alpha$ -continuous.

Theorem 3.12: Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a function then the following statements are equivalent,

- i.  $f$  is sbg-continuous function
- ii. For each point  $x \in X$  and each open set of  $Y$  with  $f(x) \in V$ , there exist a sbg-open set  $U$  of  $X$  such that  $x \in U$ ,  $f(U) \subseteq V$ .

Proof:

(i)  $\implies$  (ii):

Let  $f(x) \in V$ , then  $x \in f^{-1}(V)$ . Since  $f$  is sbg-continuous,  $f^{-1}(V)$  is sbg-open in  $X$ . Let  $U = f^{-1}(V)$ , then  $x \in U$  and  $f(U) \subseteq V$ .

(ii)  $\implies$  (i):

Let  $V$  be any open set in  $Y$  and  $x \in f^{-1}(V)$ . Then  $f(x) \in V$ . From (ii), there exists a sbg-open set  $U_x$  of  $X$  such that  $x \in U_x \subseteq f^{-1}(V)$  and  $f^{-1}(V) = \bigcup \{ U_x \}$ . Then  $f^{-1}(V)$  is sbg-open in  $X$ . Hence,  $f$  is sbg-continuous.

Theorem 3.13: If a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is contra sbg-continuous and  $Y$  is regular, then  $f$  is sbg-continuous.

Proof: Let  $x \in X$  and  $V$  be an open set in  $Y$  with  $f(x) \in V$ . Since  $Y$  is regular, there exists an open set  $W$  in  $Y$  such that  $f(x) \in W$  and  $Cl(W) \subseteq V$ . Since  $f$  is contra sbg-continuous and  $Cl(W)$  is a closed subset of  $Y$  with  $f(x) \in Cl(W)$ . By theorem 3.9, there exist a sbg-open set  $U$  of  $X$  with  $x \in U$  such that  $f(U) \subseteq Cl(W)$ . That is,  $f(U) \subseteq V$ . By theorem 3.12,  $f$  is sbg-continuous.

Definition 3.14: A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is said to be strongly sbg-continuous if  $f^{-1}(V)$  is closed in  $(X, \tau)$  for every sbg-closed set  $V$  in  $(Y, \sigma)$ .

Example 3.15: Let  $X = Y = \{a, b, c\}$  with topologies

$\tau = \{X, \phi, \{a\}, \{b\}, \{a, b\}, \{a, c\}\}$  and  $\sigma = \{Y, \phi, \{a\}, \{a, b\}, \{a, c\}\}$

Define a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = a, f(b) = b, f(c) = c$ .

$sb\hat{g} - C(Y) = \{Y, \phi, \{b\}, \{c\}, \{b, c\}\}$

Here the inverse image of  $sb\hat{g}$ -closed sets  $\{b\}, \{c\}$  and  $\{b, c\}$  in  $(Y, \sigma)$  are  $\{b\}, \{c\}$  and  $\{b, c\}$  respectively which are closed in  $(X, \tau)$ . Hence,  $f$  is strongly  $sb\hat{g}$ -continuous.

Definition 3.16: A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is said to be perfectly  $sb\hat{g}$ -continuous if  $f^{-1}(V)$  is clopen in  $(X, \tau)$  for every  $sb\hat{g}$ -closed set  $V$  in  $(Y, \sigma)$ .

Example 3.17 : Let  $X = Y = \{a, b, c\}$  with topologies

$\tau = \{X, \phi, \{a\}, \{b\}, \{a, b\}, \{a, c\}\}$  and  $\sigma = \{Y, \phi, \{a, c\}\}$

Define a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = a, f(b) = b, f(c) = c$ .

$sb\hat{g} - C(Y) = \{Y, \phi, \{b\}\}$

Here the inverse image of  $sb\hat{g}$ -closed set  $\{b\}$  in  $(Y, \sigma)$  is  $\{b\}$  which is both open and closed in  $(X, \tau)$ . Hence,  $f$  is perfectly  $sb\hat{g}$ -continuous.

Definition 3.18: A topological space  $(X, \tau)$  is said to be  $sb\hat{g}$ -Hausdorff (or  $sb\hat{g}$ - $T_2$  space) if for each pair of distinct points  $x$  and  $y$  in  $X$ , there exists  $sb\hat{g}$ -open subsets  $U$  and  $V$  of  $X$  containing  $x$  and  $y$  respectively such that  $U \cap V = \phi$ .

Example 3.19: Let  $X = \{a, b, c\}$  with a topology  $\tau = \{X, \phi, \{a\}, \{b\}, \{a, b\}\}$

$sb\hat{g} - O(X) = \{X, \phi, \{a\}, \{b\}, \{a, b\}, \{a, c\}, \{b, c\}\}$

Clearly  $(X, \tau)$  is  $sb\hat{g}$ -Hausdorff space.

Theorem 3.20: Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be surjective, closed and contra  $sb\hat{g}$ -continuous. If  $X$  is  $T_{sb\hat{g}}$  - space, then  $Y$  is locally indiscrete.

Proof: Let  $V$  be any open set in  $(Y, \sigma)$ . Since  $f$  is contra  $sb\hat{g}$ -continuous,  $f^{-1}(V)$  is  $sb\hat{g}$ -closed in  $(X, \tau)$ . Also, Since  $X$  is  $T_{sb\hat{g}}$  - space,  $f^{-1}(V)$  is closed in  $(X, \tau)$ . By hypothesis,  $f$  is closed and surjective,  $f(f^{-1}(V)) = V$  is closed in  $(Y, \sigma)$ . Hence,  $Y$  is locally indiscrete.

Theorem 3.21: If a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is continuous and  $(X, \tau)$  is locally indiscrete space, then  $f$  is contra  $sb\hat{g}$ -continuous.

Proof: Let  $V$  be any open set in  $(Y, \sigma)$ . Since  $f$  is continuous,  $f^{-1}(V)$  is open in  $(X, \tau)$ . Since  $X$  is locally indiscrete,  $f^{-1}(V)$  is closed in  $(X, \tau)$ . By Proposition 3.4 in [3],  $f^{-1}(V)$  is  $sb\hat{g}$ -closed in  $(X, \tau)$ . Hence,  $f$  is contra  $sb\hat{g}$ -continuous.

Theorem 3.22: If a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is contra  $sb\hat{g}$ -continuous, injective and  $Y$  is Urysohn space, then the topological space  $X$  is  $sb\hat{g}$ -Hausdorff.

Proof: Let  $x_1$  and  $x_2$  be two distinct points of  $X$ . Suppose  $y_1 = f(x_1)$  and  $y_2 = f(x_2)$ . Since  $f$  is injective,  $x_1 \neq x_2$  then  $y_1 \neq y_2$ . Since  $Y$  is Urysohn, there exist open sets  $V_1$  and  $V_2$  containing  $y_1$  and  $y_2$  respectively in  $Y$  such that  $Cl(V_1) \cap Cl(V_2) = \phi$ . Since  $f$  is contra  $sb\hat{g}$ -continuous. By theorem 3.12, there exists  $sb\hat{g}$ -open sets  $U_1$  and  $U_2$  containing  $x_1$  and  $x_2$  respectively in  $X$  such that  $f(U_1) \subseteq Cl(V_1)$  and  $f(U_2) \subseteq Cl(V_2)$ . Since  $Cl(V_1) \cap Cl(V_2) = \phi$ ,  $U_1 \cap U_2 = \phi$ . Hence,  $X$  is  $sb\hat{g}$ -Hausdorff space.

Theorem 3.23: Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a function and  $g: X \rightarrow X \times Y$  be a graph function of  $f$  defined by  $g(x) = (x, f(x))$  for every  $x \in X$ . If  $g$  is contra  $sb\hat{g}$ -continuous, then  $f$  is contra  $sb\hat{g}$ -continuous.

Proof: Let  $V$  be closed subset of  $Y$ . Then  $X \times V$  is a closed subset of  $X \times Y$ . Since  $g$  is contra  $sb\hat{g}$ -continuous,  $g^{-1}(X \times V)$  is  $sb\hat{g}$ -open subset of  $X$ . Also,  $g^{-1}(X \times V) = f^{-1}(V)$  which is  $sb\hat{g}$ -open subset of  $X$ . Hence,  $f$  is contra  $sb\hat{g}$ -continuous.

Definition 3.24: A space  $X$  is said to be locally  $sb\hat{g}$ -indiscrete if every  $sb\hat{g}$ -open set of  $X$  is closed in  $X$ .

Example 3.25: Let  $X = \{a, b, c\}$  with topology

$\tau = \{X, \phi, \{c\}, \{a, b\}\}$

$sb\hat{g} - O(X) = \{X, \phi, \{c\}, \{a, b\}\}$

Here every  $sb\hat{g}$ -open set in  $X$  is closed in  $X$ . Hence,  $X$  is locally  $sb\hat{g}$ -indiscrete space.

Theorem 3.26: If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is contra  $sb\hat{g}$ -continuous with  $X$  as locally  $sb\hat{g}$ -indiscrete, then  $f$  is continuous.

Proof: Let  $V$  be any open set in  $(Y, \sigma)$ . Then  $f^{-1}(V)$  is  $sb\hat{g}$ -closed in  $X$ . Since  $X$  is locally  $sb\hat{g}$ -indiscrete space,  $f^{-1}(V)$  is open in  $X$ . Thus,  $f$  is continuous.

#### 4. CONTRA $sb\hat{g}$ -IRRESOLUTE FUNCTIONS

Definition 4.1: A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called contra  $sb\hat{g}$ -irresolute, if  $f^{-1}(V)$  is  $sb\hat{g}$ -closed in  $(X, \tau)$  for every  $sb\hat{g}$ -open set  $V$  in  $(Y, \sigma)$ .

Example 4.2: Let  $X = Y = \{a, b, c\}$  with topologies

$\tau = \{X, \phi, \{a\}, \{b\}, \{a, b\}\}$  and  $\sigma = \{Y, \phi, \{b\}\}$

Define a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = a, f(b) = c, f(c) = b$ .

$sb\hat{g} - C(X) = \{X, \phi, \{a\}, \{b\}, \{c\}, \{a, c\}, \{b, c\}\}$

$sb\hat{g} - O(Y) = \{Y, \phi, \{b\}, \{b, c\}, \{a, b\}\}$

Here the inverse image of  $sb\hat{g}$ -open set  $\{b\}, \{b, c\}$  and  $\{a, b\}$  in  $(Y, \sigma)$  are  $\{c\}, \{b, c\}$  and  $\{a, c\}$  respectively which are  $sb\hat{g}$ -closed set in  $(X, \tau)$ . Hence,  $f$  is contra  $sb\hat{g}$ -irresolute function.

Remark 4.3: The following example shows that the concepts of  $sb\hat{g}$ -irresolute function and contra  $sb\hat{g}$ -irresolute are independent of each other.

Example 4.4:

1. Let  $X = Y = \{a, b, c, d\}$  with topologies  
 $\tau = \{X, \phi, \{a\}, \{a, c\}, \{a, b, d\}\}$  and  $\sigma = \{Y, \phi, \{b\}, \{a, b\}, \{b, c, d\}\}$   
 Define a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = b, f(b) = a, f(c) = c, f(d) = d$ .  
 $sb\hat{g}-C(X) = \{X, \phi, \{b\}, \{c\}, \{d\}, \{b, c\}, \{c, d\}, \{b, d\}, \{b, c, d\}\}$   
 $sb\hat{g}-O(Y) = \{Y, \phi, \{a\}, \{c\}, \{d\}, \{a, c\}, \{a, d\}, \{c, d\}, \{a, c, d\}\}$   
 $sb\hat{g}-C(Y) = \{Y, \phi, \{b\}, \{a, b\}, \{b, c\}, \{b, d\}, \{a, b, c\}, \{a, b, d\}, \{b, c, d\}\}$

Clearly  $f$  is contra  $sb\hat{g}$ -irresolute but not  $sb\hat{g}$ -closed set  $\{b\}, \{a, b\}, \{b, c\}, \{b, d\}, \{a, b, c\}, \{a, b, d\}$  and  $\{b, c, d\}$  in  $Y$  are  $\{a\}, \{a, b\}, \{a, c\}, \{a, d\}, \{a, b, c\}, \{a, b, d\}$  and  $\{a, c, d\}$  respectively which are not  $sb\hat{g}$ -closed in  $(X, \tau)$ .

2. Let  $X = Y = \{a, b, c\}$  with topologies  
 $\tau = \{X, \phi, \{a\}, \{b\}, \{a, b\}, \{a, c\}\}$  and  $\sigma = \{Y, \phi, \{a\}, \{a, b\}\}$   
 Define a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = b, f(b) = a, f(c) = c$ .  
 $sb\hat{g}-C(X) = \{X, \phi, \{b\}, \{c\}, \{a, c\}, \{b, c\}\}$   
 $sb\hat{g}-O(Y) = \{Y, \phi, \{a\}, \{a, b\}, \{a, c\}\}$   
 $sb\hat{g}-C(Y) = \{Y, \phi, \{b\}, \{c\}, \{b, c\}\}$

Here, the inverse image of  $sb\hat{g}$ -open sets  $\{a\}, \{a, b\}$  in  $(Y, \sigma)$  are  $\{a\}, \{a, b\}$  which are not  $sb\hat{g}$ -closed set in  $(X, \tau)$ . Hence, the  $f$  is  $sb\hat{g}$ -irresolute but not contra  $sb\hat{g}$ -irresolute.

Theorem 4.5: Every contra  $sb\hat{g}$ -irresolute function is contra  $sb\hat{g}$ -continuous.

Proof: Let  $V$  be any open set in  $(Y, \sigma)$ . By proposition 3.4 in [3],  $V$  is  $sb\hat{g}$ -open in  $Y$ . Since  $f$  is contra  $sb\hat{g}$ -irresolute,  $V$  is  $sb\hat{g}$ -closed in  $(X, \tau)$ . Hence,  $f$  is contra  $sb\hat{g}$ -continuous.

The converse of the above theorem need not be true as shown in the following example.

Example 4.6: Let  $X = Y = \{a, b, c\}$  with topologies  
 $\tau = \{X, \phi, \{a\}, \{c\}, \{a, c\}, \{b, c\}\}$  and  $\sigma = \{Y, \phi, \{a\}\}$   
 Define a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = a, f(b) = b, f(c) = c$ .  
 $sb\hat{g}-C(X) = \{X, \phi, \{a\}, \{b\}, \{a, b\}, \{b, c\}\}$   
 $sb\hat{g}-O(Y) = \{Y, \phi, \{a\}, \{a, b\}, \{a, c\}\}$

Here, the inverse image of  $sb\hat{g}$ -open set  $\{a, c\}$  in  $(Y, \sigma)$  are  $\{a, c\}$  which is not  $sb\hat{g}$ -closed set in  $(X, \tau)$ . Hence, the  $f$  is contra  $sb\hat{g}$ -continuous but not contra  $sb\hat{g}$ -irresolute.

Remark 4.7: The following example shows that the concepts of  $sb\hat{g}$ -continuous and contra  $sb\hat{g}$ -continuous are independent of each other.

Example 4.8:

1. Let  $X = Y = \{a, b, c, d\}$  with topologies

$\tau = \{X, \phi, \{a\}, \{a, c\}, \{a, b, d\}\}$  and  $\sigma = \{Y, \phi, \{b\}, \{a, b\}, \{b, c, d\}\}$   
 Define a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = b, f(b) = a, f(c) = d, f(d) = c$ .

$sb\hat{g}-C(X) = \{X, \phi, \{b\}, \{c\}, \{d\}, \{b, c\}, \{c, d\}, \{b, d\}, \{b, c, d\}\}$

Since the inverse image of open sets  $\{b\}, \{a, b\}$  and  $\{b, c, d\}$  in  $(Y, \sigma)$  are  $\{a\}, \{a, b\}$  and  $\{a, c, d\}$  respectively which are not  $sb\hat{g}$ -closed in  $(X, \tau)$ ,  $f$  is not contra  $sb\hat{g}$ -continuous. Since the inverse image of closed sets  $\{a\}, \{c, d\}$  and  $\{a, c, d\}$  in  $(Y, \sigma)$  are  $\{b\}, \{c, d\}$  and  $\{b, c, d\}$  respectively which are  $sb\hat{g}$ -closed in  $(X, \tau)$ ,  $f$  is  $sb\hat{g}$ -continuous. Hence,  $f$  is  $sb\hat{g}$ -continuous but not contra  $sb\hat{g}$ -continuous.

2. Let  $X = Y = \{a, b, c\}$  with topologies  
 $\tau = \{X, \phi, \{b\}\}$  and  $\sigma = \{Y, \phi, \{a, c\}\}$   
 Define a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = a, f(b) = b, f(c) = c$ .  
 $sb\hat{g}-C(X) = \{X, \phi, \{a\}, \{c\}, \{a, c\}\}$

Since the inverse image of an open set  $\{a, c\}$  in  $Y$  is  $\{a, c\}$  which is  $sb\hat{g}$ -closed in  $X$ ,  $f$  is contra  $sb\hat{g}$ -continuous. Also, since the inverse image of a closed set  $\{b\}$  in  $Y$  is  $\{b\}$  which is not  $sb\hat{g}$ -closed in  $X$ ,  $f$  is not  $sb\hat{g}$ -continuous. Hence,  $f$  is contra  $sb\hat{g}$ -continuous but not  $sb\hat{g}$ -continuous.

## 5. PERFECTLY CONTRA $sb\hat{g}$ -IRRESOLUTE FUNCTION

Definition 5.1: A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called perfectly contra  $sb\hat{g}$ -irresolute function if  $f^{-1}(V)$  is  $sb\hat{g}$ -clopen in  $(X, \tau)$  for every  $sb\hat{g}$ -open set  $V$  in  $(Y, \sigma)$ .

Example 5.2: Let  $X = Y = \{a, b, c\}$  with topologies  
 $\tau = \{X, \phi, \{a\}, \{b, c\}\}$  and  $\sigma = \{Y, \phi, \{a, b\}, \{c\}\}$   
 Define a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = c, f(b) = a, f(c) = b$ .  
 $sb\hat{g}-O(X) = \{X, \phi, \{a\}, \{b, c\}\}$   
 $sb\hat{g}-O(Y) = \{Y, \phi, \{c\}, \{a, b\}\}$

Since the inverse images of all  $sb\hat{g}$ -open sets in  $(Y, \sigma)$  are  $sb\hat{g}$ -clopen set in  $(X, \tau)$ ,  $f$  is perfectly contra  $sb\hat{g}$ -irresolute function.

Theorem 5.3:

- 1) Every perfectly contra  $sb\hat{g}$ -irresolute map is contra  $sb\hat{g}$ -irresolute map.
- 2) Every perfectly contra  $sb\hat{g}$ -irresolute map is  $sb\hat{g}$ -irresolute map.

Proof:

(1) and (2) directly follows from the definitions 2.4, 4.1 and 5.1.

The converse of the above theorem need not be true as shown in the following example.

Example 5.4:

1) Let  $X = Y = \{a, b, c\}$  with topologies  $\tau = \{X, \phi, \{a\}, \{b\}, \{a, b\}\}$  and  $\sigma = \{Y, \phi, \{b\}\}$ . Define a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = a, f(b) = c, f(c) = b$ .

$$sb\hat{g} - O(X) = \{X, \phi, \{a\}, \{b\}, \{a, b\}, \{a, c\}, \{b, c\}\}$$

$$sb\hat{g} - O(Y) = \{Y, \phi, \{b\}, \{a, b\}, \{b, c\}\}$$

Since the inverse image of  $sb\hat{g}$ -open set  $\{b\}$  in  $(Y, \sigma)$  is  $\{c\}$  which is  $sb\hat{g}$ -closed set in  $(X, \tau)$  but not  $sb\hat{g}$ -open set in  $X$ ,  $f$  is contra  $sb\hat{g}$ -irresolute but not perfectly contra  $sb\hat{g}$ -irresolute function.

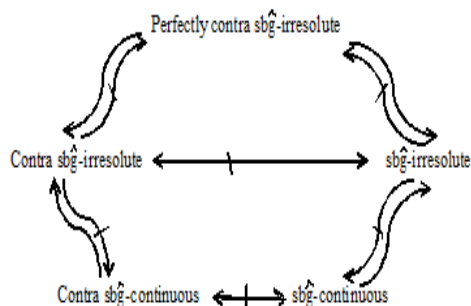

2) Let  $X = Y = \{a, b, c\}$  with topologies  $\tau = \{X, \phi, \{a\}, \{b\}, \{a, b\}, \{a, c\}\}$  and  $\sigma = \{Y, \phi, \{a\}, \{a, b\}, \{a, c\}\}$ . Define a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = a, f(b) = b, f(c) = c$ .

$$sb\hat{g} - O(X) = \{X, \phi, \{a\}, \{b\}, \{a, b\}, \{a, c\}\}$$

$$sb\hat{g} - O(Y) = \{Y, \phi, \{a\}, \{a, b\}, \{a, c\}\}$$

Since the inverse image of  $sb\hat{g}$ -open sets  $\{a\}$  and  $\{a, b\}$  in  $(Y, \sigma)$  are  $\{a\}$  and  $\{a, b\}$  respectively which are  $sb\hat{g}$ -open set in  $(X, \tau)$  but not  $sb\hat{g}$ -closed set in  $(X, \tau)$ ,  $f$  is  $sb\hat{g}$ -irresolute but not perfectly contra  $sb\hat{g}$ -irresolute function.

Remark 5.5: From the above discussions and known results, we have the following diagram.

In this diagram,  $A \rightarrow B$  means  $A$  implies  $B$  but not conversely.  $A \leftrightarrow B$  means  $A$  and  $B$  are independent of each other.

## 6. COMPOSITION OF TWO MAPS

The following example shows that the composition of two contra  $sb\hat{g}$ -continuous function need not be contra  $sb\hat{g}$ -continuous.

Example 6.1: Let  $X = Y = Z = \{a, b, c\}$  with topologies  $\tau = \{X, \phi, \{a\}, \{c\}, \{a, c\}, \{b, c\}\}$ ,  $\sigma = \{Y, \phi, \{b\}\}$  and  $\eta = \{Z, \phi, \{a, c\}\}$

Define a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = a, f(b) = b, f(c) = c$  and  $g: (Y, \sigma) \rightarrow (Z, \eta)$  by  $g(a) = a, g(b) = b, g(c) = c$ .

$$sb\hat{g} - C(X) = \{X, \phi, \{a\}, \{b\}, \{a, b\}, \{b, c\}\}$$

$$sb\hat{g} - C(Y) = \{Y, \phi, \{a\}, \{c\}, \{a, c\}\}$$

Clearly  $f$  and  $g$  are contra  $sb\hat{g}$ -continuous. But their composition is not contra  $sb\hat{g}$ -continuous, since  $(g \circ f)^{-1}$  of an open set  $\{a, c\}$  in  $(Z, \eta)$  is  $\{a, c\}$  which is not  $sb\hat{g}$ -closed in  $(X, \tau)$ . Hence,  $g \circ f$  is not contra  $sb\hat{g}$ -continuous.

Theorem 6.2: The composition of two strongly  $sb\hat{g}$ -continuous function is strongly  $sb\hat{g}$ -continuous function.

Proof: Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  and  $g: (Y, \sigma) \rightarrow (Z, \eta)$  be strongly  $sb\hat{g}$ -continuous functions. Let  $V$  be  $sb\hat{g}$ -closed set in  $(Z, \eta)$ . Since  $g$  is strongly  $sb\hat{g}$ -continuous,  $g^{-1}(V)$  is closed in  $(Y, \sigma)$ . By Proposition 3.4 in [3],  $g^{-1}(V)$  is  $sb\hat{g}$ -closed in  $(Y, \sigma)$ . Since  $f$  is strongly  $sb\hat{g}$ -continuous,  $f^{-1}(g^{-1}(V)) = (g \circ f)^{-1}(V)$  is closed in  $(X, \tau)$ . Therefore,  $g \circ f$  is strongly  $sb\hat{g}$ -continuous.

Theorem 6.3: The composition of two perfectly  $sb\hat{g}$ -continuous function is perfectly  $sb\hat{g}$ -continuous function.

Proof: Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  and  $g: (Y, \sigma) \rightarrow (Z, \eta)$  be perfectly  $sb\hat{g}$ -continuous functions. Let  $V$  be  $sb\hat{g}$ -closed set in  $(Z, \eta)$ . Since  $g$  is perfectly  $sb\hat{g}$ -continuous,  $g^{-1}(V)$  is clopen in  $(Y, \sigma)$ . By Proposition 3.4 in [3],  $g^{-1}(V)$  is  $sb\hat{g}$ -clopen in  $(Y, \sigma)$ . Since  $f$  is perfectly  $sb\hat{g}$ -continuous,  $f^{-1}(g^{-1}(V)) = (g \circ f)^{-1}(V)$  is clopen in  $(X, \tau)$ . Therefore,  $g \circ f$  is perfectly  $sb\hat{g}$ -continuous.

The following example shows that the composition of two contra  $sb\hat{g}$ -irresolute function need not be contra  $sb\hat{g}$ -irresolute.

Example 6.4: Let  $X = Y = \{a, b, c\}$  with topologies  $\tau = \{X, \phi, \{a\}, \{b\}, \{a, b\}\}$ ,  $\sigma = \{Y, \phi, \{b\}\}$  and  $\eta = \{Z, \phi, \{a, c\}\}$

Define a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = a, f(b) = c, f(c) = b$  and  $g: (Y, \sigma) \rightarrow (Z, \eta)$  by  $g(a) = a, g(b) = b, g(c) = c$ .

$$sb\hat{g} - C(X) = \{X, \phi, \{a\}, \{b\}, \{c\}, \{a, c\}, \{b, c\}\}$$

$$sb\hat{g} - O(Y) = \{Y, \phi, \{b\}, \{b, c\}, \{a, b\}\}$$

$$sb\hat{g} - O(Z) = \{Z, \phi, \{a, c\}\}$$

Clearly  $f$  and  $g$  are contra  $sb\hat{g}$ -irresolute function. But their composition is not contra  $sb\hat{g}$ -irresolute, since  $(g \circ f)^{-1}$  of an open set  $\{a, c\}$  in  $(Z, \eta)$  is  $\{a, c\}$  which is not  $sb\hat{g}$ -closed in  $(X, \tau)$ . Hence,  $g \circ f$  is not contra  $sb\hat{g}$ -continuous.

Theorem 6.5: The composition of two perfectly contra  $sb\hat{g}$ -irresolute function is perfectly contra  $sb\hat{g}$ -irresolute function.

Proof: Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  and  $g: (Y, \sigma) \rightarrow (Z, \eta)$  be perfectly contra  $sb\hat{g}$ -irresolute functions. Let  $V$  be any  $sb\hat{g}$ -open set in  $(Z, \eta)$ . Since  $g$  is perfectly contra  $sb\hat{g}$ -irresolute,  $g^{-1}(V)$  is  $sb\hat{g}$ -clopen in  $(Y, \sigma)$ . Since  $f$  is perfectly contra  $sb\hat{g}$ -irresolute,  $f^{-1}(g^{-1}(V)) = (g \circ f)^{-1}(V)$  is  $sb\hat{g}$ -clopen in  $(X, \tau)$ . Therefore,  $g \circ f$  is perfectly contra  $sb\hat{g}$ -irresolute.

Theorem 6.6: If a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is strongly sbg-continuous function and  $g: (Y, \sigma) \rightarrow (Z, \eta)$  is contra sbg-continuous function then  $g \circ f: (X, \tau) \rightarrow (Z, \eta)$  is contra continuous.

Proof: Let  $V$  be any open set in  $(Z, \eta)$ . Since  $g$  is contra sbg-continuous,  $g^{-1}(V)$  is sbg-closed in  $(Y, \sigma)$ . Since  $f$  is strongly sbg-continuous,  $f^{-1}(g^{-1}(V)) = (g \circ f)^{-1}(V)$  is closed in  $(X, \tau)$ . Hence,  $g \circ f$  is contra continuous.

Theorem 6.7: If a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is contra sbg-irresolute function and  $g: (Y, \sigma) \rightarrow (Z, \eta)$  is sbg-irresolute function then  $g \circ f: (X, \tau) \rightarrow (Z, \eta)$  is contra sbg-irresolute.

Proof: Let  $V$  be any sbg-open set in  $(Z, \eta)$ . Since  $g$  is sbg-irresolute,  $g^{-1}(V)$  is sbg-open in  $(Y, \sigma)$ . Since  $f$  is contra sbg-irresolute,  $f^{-1}(g^{-1}(V)) = (g \circ f)^{-1}(V)$  is sbg-closed in  $(X, \tau)$ . Hence,  $g \circ f$  is contra sbg-irresolute.

Theorem 6.8: If a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is contra sbg-irresolute function and  $g: (Y, \sigma) \rightarrow (Z, \eta)$  is sbg-continuous function then  $g \circ f: (X, \tau) \rightarrow (Z, \eta)$  is contra sbg-continuous.

Proof: Let  $V$  be any open set in  $(Z, \eta)$ . Since  $g$  is sbg-continuous,  $g^{-1}(V)$  is sbg-open in  $(Y, \sigma)$ . Since  $f$  is contra sbg-irresolute,  $f^{-1}(g^{-1}(V)) = (g \circ f)^{-1}(V)$  is sbg-closed in  $(X, \tau)$ . Hence,  $g \circ f$  is contra sbg-continuous.

Theorem 6.9: If a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is sbg-irresolute function with  $Y$  as locally indiscrete space and  $g: (Y, \sigma) \rightarrow (Z, \eta)$  is contra sbg-continuous function then  $g \circ f: (X, \tau) \rightarrow (Z, \eta)$  is sbg-continuous.

Proof: Let  $V$  be any open set in  $(Z, \eta)$ . Since  $g$  is contra sbg-continuous,  $g^{-1}(V)$  is sbg-open in  $(Y, \sigma)$ . But  $Y$  is locally sbg-indiscrete,  $g^{-1}(V)$  is closed in  $(Y, \sigma)$ . By Proposition 3.4 in [3],  $g^{-1}(V)$  is sbg-closed in  $(Y, \sigma)$ . Since  $f$  is sbg-irresolute,  $f^{-1}(g^{-1}(V)) = (g \circ f)^{-1}(V)$  is sbg-closed in  $(X, \tau)$ . Hence,  $g \circ f$  is contra sbg-continuous.

Theorem 6.10: If a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is sbg-irresolute function and  $g: (Y, \sigma) \rightarrow (Z, \eta)$  is contra sbg-continuous function then  $g \circ f: (X, \tau) \rightarrow (Z, \eta)$  is contra sbg-continuous.

Proof: Let  $V$  be any open set in  $(Z, \eta)$ . Since  $g$  is contra sbg-continuous,  $g^{-1}(V)$  is sbg-closed in  $(Y, \sigma)$ . Since  $f$  is sbg-irresolute,  $f^{-1}(g^{-1}(V)) = (g \circ f)^{-1}(V)$  is sbg-closed in  $(X, \tau)$ . Hence,  $g \circ f$  is contra sbg-continuous.
