**Abstract.** In this paper, we used different method and find all solutions of exponential Diophantine equations  $2^x + 41^y = z^2$ , where  $x, y, z$  are non negative integers.

**Key words and phrases.** Exponential Diophantine equations 2010 Mathematics Subject Classification. 11D09, 11D99.

## 1. INTRODUCTION

Diophantine analysis deals with various techniques of solving Diophantine equations .If a Diophantine equation has variables as exponents, it is said to be exponential Diophantine equation. In this note, we will find all solutions of exponential Diophantine equation  $2^x + 41^y = z^2$ , where  $x, y, z$  are non negative integers.

## 2. MAIN RESULTS

**Theorem 1.** [4] .The only solutions to the Diophantine equation  $2^x + 41^y = z^2$  in non negative integers are given by  $(x, y, z) \in \{(1, 0, 3), (1, 1, 7)\}$ .

**Theorem 2.** [1]. The equation  $2^x + b^y = z^2$ ,  $b, x, y, z \in \mathbb{N}$ ,  $\gcd(b, z) = 1, b > 1, x > 1, y \geq 3$  has only solution  $(b, x, y, z) = (17, 7, 3, 71)$ .

**Theorem 3.** [5] The equation  $2^x + b^y = c^z$  admits the solution for  $x > 1, y = 1, 2 \mid z$  and  $2^x < b^{\frac{50}{13}}$ .

**Theorem 4.** The only solutions  $(x, y, z) \in \mathbb{N}^3$  to the equation  $2^x + 41^y = z^2$  are  $(3, 1, 7), (7, 1, 13)$ .

**Proof.** Let  $x, y, z \in \mathbb{N}$ . First, we determine the parity of  $x, y$  and  $z$ . Since  $x \geq 1$ , then, obviously  $z$  is odd. Moreover, its clear that the equation  $2^x + 41^y = z^2$  may admit a solution  $(x, y, z) \in \mathbb{N}^3$  provided  $y$  is odd, otherwise, we will have a contradiction ([2]). Suppose now that  $2^x + 41^y = z^2$  holds true for some tuples  $(x, y, z)$  where  $x, y$  and  $z$  are all odd. We consider two cases, case 1, where  $3 \mid x$  and case 2 is where  $3$  is not divisible by  $x$ .

**Case 1.** If  $x = 3k$ , where  $k$  is natural, and  $2$  is not divisible by  $k$ , then we have  $2^{3k} + 41^y = z^2$  or equivalently  $8^k + 41^y = z^2$ . In view of Theorem 1, the only solution  $(k, y, z) \in \mathbb{N}^3$  is  $(1, 1, 7)$ . Hence we get  $(3, 1, 7)$  as only solution to  $2^x + 41^y = z^2$  in  $\mathbb{N}$ , for  $x$  divisible by  $3$ .

**Case 2.** Now, suppose that  $3$  is not divisible by  $x$ . First, we suppose that  $x = 1$ . Then we have  $2 + 41^y = z^2$ . Note that  $41^y \equiv 1 \pmod{4}$ . Hence we get  $2 + 41^y \equiv 3 \pmod{4}$  while  $z^2 \equiv 1 \pmod{4}$ , a contradiction. Hence  $x > 1$ . Apparently,  $41$  is not divisible by  $z$  because of congruence  $2^x \equiv 0 \pmod{41}$ . So for  $y \geq 3$ , the only solution we get is  $(x, y, z) = (7, 3, 71)$  (Theorem 2). Now consider the case for  $y = 1$ . Since  $z$  has quadratic exponent, we know that the equation  $2^x + 41 = z^2$  may admit a solution in  $\mathbb{N}$  such that  $x < \frac{50 \log 41}{13 \log 2} < 41$ . (Theorem 3).

Since the bound for  $x$  is small, one can effectively use a simple mathematical program to find whether there is any integer  $x$  on the interval  $(1, 41)$  that makes the quantity  $\sqrt{2^x + 41}$  an integer. Nevertheless, the values of  $x$  that could satisfy the equation may be obtained theoretically, and this we show as follows:

**Case 1.** If  $x = 3k$ , where  $k$  is natural, and  $2$  is not divisible by  $k$ , then we have  $2^{3k} + 41^y = z^2$  or equivalently  $8^k + 41^y = z^2$ . In view of Theorem 1, the only solution  $(k, y, z) \in \mathbb{N}^3$  is  $(1, 1, 7)$ . Hence we get  $(3, 1, 7)$  as only solution to  $2^x + 41^y = z^2$  in  $\mathbb{N}$ , for  $x$  divisible by  $3$ .

**Case 2.** Now, suppose that  $3$  is not divisible by  $x$ . First, we suppose that  $x = 1$ . Then we have  $2 + 41^y = z^2$ . Note that  $41^y \equiv 1 \pmod{4}$ . Hence we get  $2 + 41^y \equiv 3 \pmod{4}$  while  $z^2 \equiv 1 \pmod{4}$ , a contradiction. Hence  $x > 1$ . Apparently,  $41$  is not divisible by  $z$  because of congruence  $2^x \equiv 0 \pmod{41}$ . So for  $y \geq 3$ , the only solution we get is  $(x, y, z) = (7, 3, 71)$  (Theorem 2). Now consider the case for  $y = 1$ . Since  $z$  has quadratic exponent, we know that the equation  $2^x + 41 = z^2$  may admit a solution in  $\mathbb{N}$  such that  $x < \frac{50 \log 41}{13 \log 2} < 41$ . (Theorem 3).

Rewriting  $2^x + 41^y = z^2$  as  $3((2^x+5)/3)=(z+6)(z-6)$ , we see that  $z$  must be at least 7. We know that  $z$  is odd so  $z=2c+3$  for  $c \geq 2$ . It follows that  $2^x$

$+41 = (2c+3)^2 = 4c^2 + 12c + 9$ , or equivalently,  $4c^2 + 12c - 2^x = 32$ . Suppose that  $c$  is even, say  $c=2^s m$  for some  $s, m \in \mathbb{N}$  where  $m$  is odd. Then,  $2^x(2^{2s+2-x} m^2 + 2^{s+2-x} 3m - 1) = 2^5 \dots (1)$ . Recall that  $x > 1$ , 3 is not divisible by  $x$  and  $x$  is odd, so  $x$  must be at least 7. Thus from (1), we get a contradiction. Hence  $c$  cannot be an even integer. Hence,  $c$  is odd. For  $x \geq 7$  and  $c$  is odd, we have  $2^x + 41 = 4c^2 + 12c + 9$ .

Hence  $2^x + 32 = 4c^2 + 12c$ , which gives  $2^{x-2} + 8 = c^2 + 3c$ .

So  $2^3(2^{x-5} + 1) = c(c+3)$ . Now,  $c$  being odd gives  $c+3=8$  or  $c=5$ . So  $2^{x-5} = 2^2$  and so  $x=7$ . Finally this gives the solution  $(x, y, z) = (7, 1, 13)$ .

Hence the final solution for  $(x, y, z) \in \mathbb{N}^3$  to  $2^x + 41^y = z^2$  are  $(3, 1, 7)$ ,  $(7, 1, 13)$ .

**Remark 1.** Further, if  $x, y, z$  are non negative, then, in this equation,  $x$  and  $z$  can never be 0. Suppose if  $x=0$ , the equation becomes  $41^y = z^2$

$-1$  will lead to a contradiction. Indeed, for  $y$  and  $z$  in  $\mathbb{N}$ , we have  $41^\alpha(41^{\beta-\alpha} - 1) = 41^\beta - 41^\alpha = (z+1) - (z-1) = 2$ , where  $\alpha + \beta = y$ . Evidently,  $\alpha=0$  gives  $41^\beta = 3$ , which is impossible. If  $z=0$ , then  $2^x + 41^y = 0$ , again impossible for non zero  $x$  and  $y$ . If  $y=0$ , then equation becomes  $2^x + 1 = z^2$  which have a solution  $(3, 0, 3)$  [3].

### 3. CONCLUSION

The all solutions of Diophantine equations  $2^x + 41^y = z^2$ , where  $x, y, z$  are non negative integers is  $\{(3, 0, 3), (3, 1, 7), (7, 1, 13)\}$ .
