Abstract - Solid waste management crises are directly related to the human health, economy and environment. In developing world, solid waste management authorities are seriously facing the associated problems in collection, transportation and disposal of communal solid waste. In Kashmir, due to improper planning and lack of funding the solid waste Management crises are turning into worst. Open dumps of municipal solid waste (MSW) are responsible for the number of vector diseases in Kashmir. Increase in per capita solid waste generation rate is another serious threat for the management authorities in the developing world. Due to diverse living practices in same town, management authorities cannot provide uniform solid waste management system, therefore in Kashmir, so many non-technical solid waste management systems are working. Due to shortage of proper collection bins in Kashmir, the collection efficiency is very low. Open dumping, open burning and improper sanitary landfills can be observed everywhere in the country. According to the Ministry of Environment Kashmir, in urban areas more than 54,850 tons of solid waste is being generated every day but unfortunately less than 50 percent of generated solid waste is being collected.

Key words: Construction technologies, Safety measures, Government control.

I. INTRODUCTION

The Srinagar city was selected as a case study during the investigation. The study area is about 25 Km from the capital of Kashmir. The city is surrounded by so many reputed industrial zones like Kashmir Ordinance Factories, Heavy Industries of Srinagar, Heavy Mechanical Complex, Air Weapon Complex, Srinagar Industrial Estates etc. The climate of the Srinagar city is humid subtropical with average rainfall of 990 mm. Most of the rainfall in study area occurs during monsoon. The overall efficiency of municipal solid waste management system in the study area is not up to satisfactory Tehsil Municipal Administration (TMA) Srinagar is responsible for the collection, storage, transportation and disposal of generated solid waste. The location plan of Srinagar city is shown in Figure 1.

II. RESEARCH OBJECTIVES

The major objective of this study was to investigate core issues related to the solid waste management in the small towns of developing world. Negative environmental impacts and other related issues due to defective management of municipal solid waste were also systematically examined during the field investigation. Solid Waste Management Issues in Small Towns of Developing World: A Case Study of Srinagar City Naeem Ejaz and Nasir Sadiq Khan International Journal of Environmental Science and Development.

III. RESEARCH METHODOLOGY

Initial data related to the overall solid waste management system in Srinagar city were collected from TMA to understand the existing practices. Other important information like collection and disposal systems, density and composition of solid waste, climate, living standard of dwellers etc were collected from the field visits and concerned departments. In-depth information related to the type of collection systems, waste composition, location of disposal sites, average generation rate per capita per day, types of containers, types of collection vehicles and number of designated staff were obtained from office of TMA and site visits. On the behalf of restored data from concerned departments and the field visits, the study area was divided into three main parts, newly planned developed areas, old unplanned developed areas and commercial developed areas. Then solid waste management crises from these areas were deeply observed according to the requirement of research activity. Considering the indigenous environmental conditions and behavior of the local dwellers, technical suggestions are also discussed as the research findings.

IV. SOLID WASTE MANAGEMENT ISSUES IN SRINAGAR CITY

Serious negative environmental impacts due to faulty handling of municipal solid waste can be observed in the Srinagar city. Open dumping of municipal solid waste is a common practice in the study area. Main streets, roads, railway tracks, open drains and undeveloped plots in the study area have been seriously contaminated as shown in following figures from 2 to 6. Many negative impacts due to faulty handling of solid waste can be seen in Srinagar city as shown in the following figures. These impacts are explained in Table 1 in detail.

Solid Collection System In Srinagar City

In Srinagar city, solid waste is being collected manually by the help of sweepers. They are normally using wheel borrows, hand carts and motorcycle rickshaws for the collection of solid waste from the streets. At most of the collection locations solid waste containers are not available and dwellers are dumping the solid waste on ground. The generated solid waste from these locations is being collected by the help of open body vehicles irregularly. The selected disposal site for the city is not suitable and producing negative environmental impacts on surrounding populations. Storage containers are not compatible with the existing system as shown in the figures 8 & 9. It is also observed during the investigation that number of containers and collection vehicles are not sufficient to handle the generated waste. Considering the field analysis, the medium size containers with maximum 4.5 ft height may be more suitable under local conditions. The collection efficiency may be increased by the implementation of medium size containers, because at present large size containers are creating a lot of difficulties while handling of MSW in the town.

Disposal Practices

Unfortunately, at present Tehsil Municipal Administration (TMA) Srinagar has no appropriate landfill or waste disposal site. Open dumping and open burning of solid wastes is being practiced in the study area as shown in figures 10 and 11. Other types of dangerous wastes like chemical and hospital wastes are also not disposed of properly.

Serious Environmental Issues In Study Area Due To Open Dumping

Open dumps of municipal solid waste are creating serious negative impacts on environment in Srinagar city. Many negative impacts are being observed in study area due to open dumping of solid waste. Heavy winds are spreading dust and filth from the open dumps to living areas and toxic gaseous emissions are continuously exposed to the atmosphere. It was also observed during the field visit that dumped solid waste at final disposal site is being burnt and creating drastic air pollution.

CONCLUSION

Developing countries are seriously struggling to design useful and economical solid waste management systems. In Srinagar city, municipal solid waste is being dumped openly along roadsides. In study area a diverse solid waste management system is in practice. Open dumps are responsible for so many negative environmental impacts in the management the existing solid waste management system is study area. Due to lack of funding and proper not working successfully in Srinagar city. Due to shortage of storage bins, collection efficiency is very low in study area. Special wastes like hospital waste and other hazardous materials are being disposed along with municipal solid waste. Considering the overall negative impacts associated with open dumping and open burning, these practices must be strongly discharged

Suggestions For Proper Disposal Of Solid Waste

Considering the present solid waste management situation in the Srinagar city the following suggestions are being presented for the improvement of system.

1. Deficiency of staff, crews, vehicles and machinery must be recovered immediately.
2. Staff training programs must be initiated to motivate the workers.
3. Pen dumping and open burning of municipal solid waste are two major threats to the town environment, these kinds of practices must be discouraged through different awareness campaigns.
4. At present a reasonable amount of solid waste is being collected by the scavengers for recycling purposes, but they are not using any health and safety measures. These kinds of activities may be motivated while considering the proper health and safety measures.
5. Due to lack of available budget, the existing solid waste management system in not working effectively. The induction of small scale recycling plants by the municipal authority may generate a reasonable financial source in coming future.
6. Considering ethics and the town environment, the transportation of collected solid waste through open body vehicles must be discouraged.
7. At present, no proper sanitary landfill site is available for the final disposal of municipal solid waste. A proper sanitary landfill site while considering the all environmental aspects may be designated immediately to avoid the environmental hazards due to illegal open dumps of collected municipal solid waste.
8. Encouragement of crews through proper incentives may be adopted to improve the sanitation practices.
